VISUAL CAM2020

MecSoft Corporation

Profile-NEST

Prefer Printed Documentation? Click Here!

The VisualCAM Profile-NEST module offers sheet nesting capability with 2-1/2 Axis Profiling toolpaths. Toolpaths can be nested individually or in groups with control over sheet size, layout and thickness, with all of the cut material simulation capabilities of the MILL module. Nesting parameters include grain control, auto-tagging, orientation, nesting reports and more, all running inside VisualCAM.

For purposes of brevity, VisualCAM-Profile-NEST will be referred to as Profile-NEST in all subsequent references.

Profile-NEST also comes with numerous post-processors to output the programmed G-code to some of the most popular machines in the market. This online help system provides comprehensive help topics as well as context sensitive ToolTips to help you become a productive user of VisualCAM.

1.1 understanding

Here is some additional information that will help you understand how Profile-NEST works:

- Profile-NEST allows you to nest 2 Axis Profiling toolpath operations onto one or more nested sheets. You can have multiple nest setups within the same Machining Job. Each are listed in the order they are processed in the Machining Job.
- The Machining Job can have one or more Setups called Setup Operations to Nest. If you expand a Setup in the Machining Job you will see that it has a set of Nesting Parameters assigned to it. You can adjust these parameters individually for each Setup. When you Regenerate a Setup the toolpath operations contained within it are updated and its associated nested sheets are also updated. Regenerating a toolpath operation will also update its associated nested sheets.
- When Nested Sheets are generated they are listed under the Setup they are associated with.

1.2 Workflow

Profile-NEST offers a quick and easy work flow for nesting 2 Axis Profiling toolpaths. Working left to right from the Nest tab, here are the basic steps:

© 2020 MecSoft Corporation

- 1. Define your Machine and Post Processor.
- 2. Define your Sheet parameters.
- 3. Set your Nesting Parameters.
- 4. Create your 2 Axis Profiling operations.
- 5. Generate your Operations to update your Nested Sheets.
- 6. Review your Nested Sheets.
- 7. Generate your Nesting Report if needed.
- 8. Simulate and Post Process.

1.3 Post-Processing

Once the machining operations have been created and verified, they can be post processed to create G-code files. These G-code files can then be sent to the controller of the machine tool to drive the actual machine tool.

Quick Start

7

Quick Start Guides for each VisualCAM module are available in both PDF and Video format. Refer to the following information to access these guides:

What's New

<u>What's New in VisualCAD/CAM 2020</u> <u>Watch the What's New in 2020 Webinar!</u>

The Complete Quick Start Video Play List

Here is a link to the complete 2020 Video Play List

How to Access the Quick Start Guide Documents

To help you quickly get started in working with each module, select one of the Help buttons located on the VisualCAM Learning Resources dialog.

You will find:

- Quick Start Guides
- What's New documents
- Online Help links

The Quick Start Guides will help you step through an example tutorial which will illustrate how to use the module. To access the Learning Resources dialog:

1. From the VisualCAD Home Ribbon Bar, drop down the Main menu and select Learn ...

To access the Learning Resources dilog in VisualCAM

2. Select a document from the Learning Resources dialog to get started using the module of your choice.

You can also select the Open Quick Start Files Folder button located at the bottom of the dialog to open the Quick Start folder where the source files (start and completed versions) are located.

User Interface

11

The VisualCAM Profile-NEST module adheres to the Windows standard for user interface design and integrated into the VisualCAD screen seamlessly.

MILL Module Displayed

A screen shot of the VisualCAM Profile-NEST module running inside of VisualCAD is shown below:

The VisualCAM MILL Interface

There are 3 main interface objects created when MILL module is loaded.

- 1. VisualCAM menu bar entry under VisualCAD menu bar
- 2. Machining Browser (Mops) window
- 3. Machining Objects (Mobs) Browser window

4.1 The Main Menu

When VisualCAM is loaded a menu item is added to the Plugins Pane of the Home Ribbon Bar. Selecting this item will display a drop down menu as shown below.

To run the Profile-NEST module, select Profile-NEST from the VisualCAM drop down menu.

Selecting Profile-NEST toggles the display of the Profile-NEST Browser window. If one of the other module browser windows are currently displayed (i.e., MILL, TURN, etc.,) selecting this will switch the display to the Profile-NEST Browser.

4.2 Profile-NEST Browsers

The Profile-NEST Browser is a dock-able window that allows management of various entities or objects that can be created in the VisualCAM Profile-NEST module. There are 2 browsers in VisualCAM – the Machining Operations Browser (Mops) and the Machining Objects Browser (Mobs).

Profile-Nest Browsers

Profile-Nest Browser

4.3 Machining Browser

The Profile-NEST Operations Browser has two main modes of operation represented by tabs at the top of the window. These are Nest and Simulate. Each tabbed view also incorporates a ribbon toolbar at the top and a toolbar at the bottom. These toolbars group all of the functions associated with the type of object in the tab.

4.3.1 Toggle Browser Tabs

Tabs are available on the Machining Browser that allow you to toggle the display of both the Machining Browser and the Machining Objects Browser.

Selecting this tab toggles between each module browser that you are currently licensed to operate. Select the button to toggle to the <u>Profile-NEST Browser</u>.

T)

Select this tab to toggle the display of the Machining Objects Browser.

4.3.2 Nest Tab

Selecting the Profile-NEST tab in the Machining Browser provides access to Machine, Stock and Operations to Nest commands. These commands are listed in the ribbon bar when the Nest tab is selected.

The Machining Operations (Mops) Browser, Nest Tab

Machine Setup Pane

This section allows you to define the Machine Tool, Post Processor and the Nested Sheets.

J Machine	Machine Tool Setup: Sets the Machine for 21/2 axis, 3	
Wachine	axis, 4 axis and 5 axis operations.	

🤣 Post	Set Post-Processor Options: Allows you to set the Current Post Processor, posted file naming conventions, posted file extension, program to display the posted file.
23 Sheets	Add Sheets by defining sheet size parameters or geometry.

Stock Pane

This section allows you to define the Machine Tool, Post Processor and the Nested Sheets.

Stock -	Create Stock Model: Allows you to create Stock geometry. User can also delete a Stock geometry by selecting Delete Stock.
Align *	Align: Allows you to Align stock model to part and locate WCS with respect to Part or Stock . This function is especially useful when the part model and the stock model are created without regard to their respective positional locations.
	Define Stock Material: Allows you to select a material from the material list.

Operations to Nest

This section allows you to create machining operations The Profile-NEST module allows you to create multiple 2 Axis Profile machining operations in a part file. This is a powerful feature that allows you to create an entire sequence of machining operations that is required in the nested sheet.

Work Zero	Add a Work Zero to set the current work coordinate location for machining.
2 1/2 Axis Profiling	Add a 2 Axis Profile toolpath operation to the Machining Job.
Resting Parameters	Set Nesting Parameters for the current Profiling Nesting Machining Job.
Nesting Report	Generate a Nesting Report of the current Machining Job.

Display Toggle Toolbar

This toolbar is located at the base of the Machining Browser and has the following controls:

B	Stock Model Visibility: Turn on/off stock model
a #	Material Texture Visibility: Turn on/off material texture visibility
al a	Toolpath Visibility: Turn on/off toolpath display
19	Hidden Toolpath Visibility: Turn the hidden portions of toolpaths on/off.
<u>&</u>	Display Toolpath Levels: Displays tool path by Z levels
ŵ	Machine CSYS Visibility: Turns on/off of Machine Coordinate System display.

4.3.3 Simulate Tab

Select the Simulate tab to run cut material simulations and toolpath animations. This tab also provides controls to vary the simulation speed, set the simulation preferences and toggle the display state of various simulation components.

Profile Nesting Browser, Simulate Tab

Simulate Tab Functions

The following controls are available on the Simulate tab:

Stock *	Create Stock Model : Allows you to create Stock geometry. You can also delete a Stock geometry by selecting Delete Stock.
Play	Perform Toolpath Simulation or Animation : Allows you to perform cut material simulation with tool animation.
Step	Simulate Next Toolpath Block: Simulation is performed in steps as defined by the display interval in the simulation preferences.
Step Levels	Simulate Next Toolpath Z Levels: Simulation is performed in separate Z levels.
To End	Simulate to End: Simulation is performed without updating the display until the end of the toolpath.

Pause	Pause Toolpath Simulation: Pause/Stop the simulation.
Stop	Stop Toolpath Simulation: Exits Simulation Mode. Pause simulation before exiting simulation mode.
· · · · · · · · · · · · · ·	Simulation Speed: Varies simulation speed
Preferences	Set Simulation Preferences: Provides access to simulation preferences.
Simulate by Moves	Simulate by Moves: Switches from Simulate by Distance to Simulate by Motions.

Simulate Toolbar Functions

The following toolbar controls are available on the Simulate tab:

<u>&</u>	Part Model Visibility: Turn on/off part model display during simulation.
B	Stock Model Visibility: Turn on/off stock model
aji	Material Texture Visibility: Turn on/off material texture visibility
88	Toolpath Visibility: Turn on/off toolpath display
8	Hidden Toolpath Visibility: Turn the hidden portions of toolpaths on/off.
	World CSYS Visibility: Turns on/off of World Coordinate System display.
after	Machine CSYS Visibility: Turns on/off of Machine Coordinate System display.
Gold	Tool Visibility : Turn on/off tool display during simulation.
67	Holder Visibility: Turn on/off tool holder display during simulation.
Mop	Simulation Display State: Use this to select the display state for the simulation. Select from Default, Tool, Mop or Texture. See Machining Operation Properties for setting unique simulation colors for each Mop (Machining Operation) in your Machining Job.

😹 📾 🐉 🖋	المحق التي المحق
Goto 419	
G010 419	
	ays the number of Goto motions of the currently simulate

4.4 Machining Objects Browser

The Machining Objects Browser has two tabs located at the top to work with Tools and Knowledge Bases. Each tabbed view also incorporates a toolbar at the top. The toolbars on each tab group all of the functions associated with the type of object in the tab.

The Machining Objects Browser can be toggled on and off by selecting the toggle button located at the top left corner of the Machining Browser. This toggle button is shown below.

Locating the Machining Objects Browser toggle tab

VisualCAM supports 2 types of tool library file formats *.vkb and *.csv (*.vkb is recommended).

Tools Tab Functions

Y

Create/Edit Tools: This button brings up the tool dialog that enables the creation and saving of tools. All milling, drilling and user defined tools can be created here. Refer to Tool section for a detailed description on creating tools and defining tool parameters.

Load Tool Library: The load tool library button enables the loading of a previously saved tool library. Refer to the following section for additional information - Load Tool Library

Select Tools from Library: The select tool library button enables you to select tools from a previously saved tool library. Refer to the following section for additional information - Select Tools from Library

Save Tool Library: This button enables the created tools to be saved in a tool library file. The file can be saved in the desired directory and read in when required. Refer to the following section for additional information - Save Tool Library

77

Unload Tool Library: This button will unload the current Tool Library.

IJ

List Tools: The button brings up all the tool properties associated with the tools currently recorded in the current MILL session. Refer to the following section for additional information - List Tools

Right-click Options on Tools

You can right-click on a Tool listed in the Mobs Browser to perform various functions. These are listed below:

🖃 👘 🚺 Too	ols	
÷… 🎽	FlatMill: 0.25	
	.375 4FL (2.550 Loc]
	.375 4FL (1.15 💊	Edit
	.375 4FL (.950 👘	-
	.375 2FL (1.18	Rename
	.375 2FL (.900 🔔	Cut
	.375 4 FL (1.0 🎽	
	.312 2 FL (.85 🛄	Сору
	.250 4 FL (.75 🖳	Paste
- 3	.250 2 FL (.75 🛄	
	.250 2 FL (.80	Add to Library
	.250 4 FL (.80	Preview
	.250 4 FL (1.1	
	Right-click Options	on a Tool

Displays the Create/Edit Tool dialog allowing you to edit the Tool parameters.

Rename

Allows you to Rename the selected tool.

K Cut / Copy / Paste

These options allow you to Cut or Copy the selected Tool to the Windows Clipboard and then Paste it back to the Tools list to create a new tool using the previous tool as a template.

Add to Library

This allows you to Add the selected Tool to an exiting Tool Library *.csv data file.

Preview

This will display a Preview of the selected Tool in the Graphics Window similar to how the Tool displays during Simulation. The Tool will display at the origin of the MCS for the current operation.

Tools Toolbar Functions

The following Tool Sorting rules (when set) will apply to both the Tools tab of the Machining Objects Browser and the Create/Select Tools dialog.

No Sort	•	↑ <u>₹</u> ↓ 🦉
Sort by Name	•	

Sorting Selector: This allows you to sort the tool list. You can select No Sort or sort by Name, Number, Type and Diameter.

Sort in Ascending/Descending Order: This icon acts like a toggle to switch between Ascending and Descending sort order.

List on the Tool used in Machining Operations: Toggle this icon to list ONLY the tools currently assigned to an operation. Note: You must Generate an operation for the assigned tool to be listed.

If you do not see any of your tools listed, check to make sure this icon is toggled OFF. If no operations are using tools yet and this icon is ON, then no tools will be listed!

Tools Status Bar

The status bar displays the currently selected tool, tool tip radius & angle, spindle speed and cut feedrate.

Flat Mill-0.5 | #1 | Dia:0.5, CRad:0, Taper:0 deg | RPM: 3055 | F: 61

Status Bar, Tools Tab, Machining Objects Browser

4.5 Docking Browsers

Both Machining Operations Browser and the Machining Objects Browser windows are dock-able windows. This means these windows can be docked in any position in VisualCAD. This section describes the procedure to be used to dock both of these windows such that they are stacked vertically.

L Step 1: Launch the MILL Browser

From the VisualCAD Home Ribbon Bar, select the VisualCAM menu from the Plugins pane and then select MILL. This displays the machining operations browser and by default is docked to the left half of the application window next to the view bar.

Step 2: Display the Tools, Machining Objects Browser

Select the Tools Machining Objects button located on the Machining Operations Browser just to the left of the Program tab. This displays the Machining Objects Browser below the operations browser.

Step 3: Drag & Drop the Browser

Selecting the title bar and holding the left mouse button down and dragging the browser window displays a widget that allows you to dock the browser to desired location. You can dock a browser inside of another browser or have them docked side by side by using the controls on the widget.

For example: Selecting the button on the widget with arrow pointing downwards on and releasing the left mouse button docks the selected browser below the specified browser.

CAM Preferences 4.6

You can set various CAM Preferences that will be saved even after you exit the program. Select the Preferences icon from the Machining Browser. When you install a new VisualCAM update you are choose to import your CAM Preferences from one version to the next.

The CAM Preferences Icon (in the MILL Module)

The available Preferences include:

Geometry

Includes color preferences for Regions and Surfaces. Show the dialog.

Stock

These include stock colors, stock edge display and stock transparency. Show the dialog.

Cutting Tools

Includes Tool colors, Tool display states and the default Tool Library preferences. Show the dialog.

Feeds & Speeds

Includes Feeds & Speed preferences such as default values and other options. Show the dialog.

Machining

Includes Arc Output, Drill Cycle Output, Toolpath Resolution and the default machining Knowledge Base preferences. <u>Show the dialog</u>.

Toolpath

Includes Toolpath Colors and Toolpath Display preferences. Show the dialog.

Simulation

Includes Simulation Type, Mode, Accuracy, Transparency and other preferences. <u>Show</u> the dialog.

User Interface

Includes General, Stock Information and Ribbon Style preferences. Show the dialog.

Licensing

Includes network licensing preferences. Show the dialog.

4.6.1 Geometry

You can set the colors to display various objects using this dialog. To change each of the color settings in this dialog select the colored button next to the item of interest. This will bring up the color selection dialog, which can be used to choose the color needed. Once a color has been selected the button will change its color to the selected one.

Preferences		×

	OK Cancel Apply Help	

Dialog Box: CAM Preferences > Geometry

CAM Preferences > Geometry

Region Colors

Containment Region

Use this color selector to set the display color for Containment Regions (i.e., your Control Geometry).

Avoid Region

Use this color selector to set the display color for Avoid Regions (i.e., your Control Geometry).

Surface Colors

Drive Surfaces

Use this color selector to set the display color for Drive Surfaces (5 Axis).

Check Surfaces

Use this color selector to set the display color for Check Surfaces (5 Axis).

4.6.2 Stock

You can set the simulation preferences using this dialog. **Note**: Some options are not available in XPR (Xpress) configuration.

Dialog Box: CAM Preferences > Stock

Users can set the simulation preferences using this dialog:

Preferences		×
Geometry	Stock Colors Stock Edges Colors	
Stock	Stock Silhouette:	-
Cutting Tools	Cut Stock	-
Feeds & Speeds	Sharp:	
Machining	Stock Edges Display	
Toolpath	Silhouette edges	
Simulation	Sharp edges Angle: 60	
User Interface	Stock Model Display Transparency	
Licensing	Opaque Transpare	ent
	-	
	OK Cancel Apply H	łelp
	CAM Preferences>Stock	

Colors

Here you can set the stock colors. You can differentiate between cut and non-cut areas by specifying different colors for them here.

Note: If the <u>Simulation Display State</u> is set to <u>Mop</u> then the Color assigned using the Machining Operation Properties is used to display the cut stock. Right-click on an operation in the Machining Job tree and select <u>Properties</u> to set this color.

Stock Edges Display

This section allows you to control the Stock Edges Display states. For example, you can check the boxes to display Silhouette Edges and Sharp Edges as well as the Angle to display for stock edges. Silhouette Edges and Sharp Edge colors are set using the Colors section of this dialog. Experimentation is advised until you are comfortable with the way your stock display.

Stock Model Transparency

Use this slider to adjust the Stock Model Transparency when the Program tab is selected (i.e., when you are not simulating).

4.6.3 Cutting Tools

You can set the Tool Library to load on startup and also specify the location of your Tool Library files.

CAM Preferences > Cutting Tools

Preferences	×
Geometry Stock Cutting Tools Feeds & Speeds Machining Toolpath Simulation User Interface Licensing	Cutting Tool Colors Tool Flutes Tool Shank Tool Holder Tool Display Solid Transparent Wireframe None Display Tool Holder Tool Library Preferences Always load last loaded tool library on startup Default Tool Library Clear

CAM Preferences > Cutting Tools

Cutting Tool Colors

Use the color selectors to set the default display colors for the cutting tool. The Tool Flutes, Tool Shank and Tool Holder can each be assigned a different.

Tool Display

The cutting tool can be displayed as either Solid, Transparent, Wireframe or None by selecting the desired option. You can also toggle the display of the Tool Holder by checking or un checking the box provided.

Tool Library Preferences

This defines your Tool Library preferences:

Always load last loaded tool library on startup

If you check this box, every time VisualCAM loads, the last loaded Tool Library will be loaded automatically.

Default tool library path

Optionally you can specify the file path for your default tool library files. **Note**: It is recommended that you save your custom tool library files to a location outside of the VisualCAM install path. This will keep them from being overwritten when you install new updates of VisualCAM.

4.6.4 Feeds & Speeds

You can set the Feeds & Speeds preferences using this dialog.

CAM Preferences > Feeds & Speeds

Preferences		×
Geometry	Load Feedrates for new operations from	
Stock	● Tool ○ Feeds & Speeds File ○ Defaults	
Cutting Tools	×	
Feeds & Speeds	% s to use for transferring from computed cut feed

	OK Cancel Apply Help	

CAM Preferences > Feeds & Speeds

Load Feedrates for operations from

This allows you to select a preference option for loading Feeds/Speeds from table or from tool or use defaults when creating a new operation.

Tool

Selecting this option loads the feeds/speeds saved with the tool when creating a new operation.

Table

Selecting this option loads the feeds/speeds based on the material selected when creating a new operation.

Defaults

Selecting this option loads the feeds/speeds from the default knowledge base when creating a new operation. If default knowledge base is set to undefined, the system defaults would be used for loading feeds and speeds.

S s to use for transfer from computed cut feed

These % values apply when using the Load from File option (i.e., commonly referred to as the Feeds & Speeds Calculator) from either the Create/Edit Tools dialog of from the Feeds & Speeds tab of any of the toolpath operation dialogs. 100% of the Cut Feed specified in this dialog is applied and a percentage of the Cut Feed is used to populate the remaining feedrates for Plunge, Approach, Engage, Retract, Departure and Transfer. You can set the % values to use here.

Feeds/Speeds Tracking Options

When you select the Load from Tool option from any of the toolpath operation dialogs, the Feeds & Speeds specified for the active tool are populated into the Feeds & Speeds tab of the operation's dialog. You can check this box to perform this automatically when new toolpath operations are created.

4.6.5 Machining

You can set the machining preferences using this dialog.

CAM Preferences > Machining

Preferences		×
Geometry Stock Cutting Tools Feeds & Speeds	Arc Output Output arcs as linear segments Output spiral motions as linear segments Output helix motions as linear segments	
Feeds & Speeds Machining Toolpath Simulation User Interface Licensing	Toolpath Arc Fitting Control (If requested in M0p) Maximum Arc Radius: 10 Constraint Plane(s) XY Plane XY Plane XY Plane XY Plane XY Plane XY Plane Maximum Arc Radius: XY Plane XY Plane XY Plane YZ Plane Y	
	OK Cancel Apply Help	1

CAM Preferences: Machining

Arc Output

Some NC machine controllers do not have arc, spiral and helical output (for example G2, G3). For such type of controllers, the arcs that are generated in the toolpath can be output as linear segments by selecting these check boxes.

Output Arcs as Linear Segments

If your controller does not support arc g-code motions, check this box to output arcs as

linear segments.

Output Spiral Motions as Linear Segments

If your controller does not support spiral g-code motions, check this box to output spiral motions as linear segments.

Output Helix Motions as Linear Segments

If your controller does not support spiral g-code motions, check this box to output spiral motions as linear segments.

Toolpath Arc Fitting Control (If requested in Mop)

Some toolpath operations support Arc Fitting. If supported, the option is located on the Advanced Cut Parameters tab of the operation's dialog.

Maximum Arc Radius

Some toolpath operations support Arc Fitting. You can enter here the Maximum Arc Radius that can be created.

XY Plane

Check this box to Perform Arc Fitting. The system will attempt to fit arcs along the computer toolpath if they lie within the three principal planes (XY Plane, XZ Plane or YZ Plane).

XZ Plane

Arcs can be fitted to linear toolpaths that lie on one of the three principal planes XY, XZ or YZ. Check the box for which plane to fit arcs to.

YZ Plane

Arcs can be fitted to linear toolpaths that lie on one of the three principal planes XY, XZ or YZ. Check the box for which plane to fit arcs to.

Drill Cycle Output

This section refers to Hole Machining Drill Cycles.

Always output Drill Cycles as linear motions.

Check the box if your wish to always output Drill Cycles as linear motions.

Tool Programmed Point (P)

The toolpath can be output as the tool tip or the tool center. If Tool Center is selected, the toolpath will be offset by the difference in the height of the tool tip and tool center. The default value is the Tool Tip.

Changing machining preferences requires regeneration of machining operations to apply the changes.

Toolpath Generation Settings

Part Sampling Resolution

This slider is used to control the display quality of the simulated model. Standard is faster but with lower display quality. For large parts, use the Standard or Medium options, while for smaller parts Medium or Fine options would work satisfactorily.

Always generate toolpath in multiple threads

Check this box to Always generate toolpath in multiple threads. The system will distribute the computing of multiple toolpaths to different cores in your processor simultaneously rather than sequentially. Refer to Multi-threading Manager section for additional information.

Default Parameters

Default Knowledge Base

This allows you to select a Default Knowledge Base to load for creating machining operations. Selecting a knowledge base as Default loads the operation parameters when creating new operations. If no Default knowledge base is specified, the system defaults

are used for machining operation parameters.

Source Folder for Knowledge Base

This is the source folder where the Default Knowledge Base are stored.

4.6.5.1 Multi-threading Manager

This distributes computing of toolpath to different cores in your processor simultaneously rather than process them sequentially when regenerating multiple operations.

Multi-Threaded Machining Operations Regeneration Manager			
Machining Operation	Status		
Horizontal Roughing Horizontal Finishing Pencil Tracing Valley Remachining	ed Larted		
•	III.		

Multi-threading Manager

To enable generation of toolpath using multi-threading manager, select Always generate toolpath in multiple threads from Machining Preferences located under CAM Preferences in the Machining browser.

Regenerating the Machining Job, Setup or machining operations displays the multi-threading manager window and indicates the progress of the toolpath computation.

Multi-threading Manager window displayed

You can still continue working with the application when the toolpath generation is in progress with the multi-threading manager dialog active.

4.6.6 Toolpath

These preferences relate to the graphical display of toolpath cut motions.

39

Preferences	×

CAM Preferences > Toolpath

Toolpath Colors

Use the color selectors to define the display color for each motion in the toolpath. The following can be set: Cut Motion, Plunge, Approach, Engage, Retract, Departure, Rapid and Cut Arc.

Toolpath Display

These preferences control the display of the toolpath in the graphics window.

Toolpath Display

This refers to the graphical display of toolpaths. Enter a value to effect the size of the toolpath during display.

Display Tool Positions Size (Pixels)

Check this box to display tool position locators. Each coordinate represents one tool position. Then enter the Pixel Size for the locator point as well as the Pixel Color of the position points. You can also use the color selector to assign a color to these markers.

Display Tool Axis

Check this box to display the Tool Axis line. You can then enter a Length for the axis line and use the Color selector to assign it a color.

4.6.7 Simulation

You can set the simulation preferences using this dialog. **Note**: Some options are not available in XPR (Xpress) configuration.

Dialog Box: CAM Preferences > Simulation

Licensing	Standard Medium Fine Use Specified Spacing for Voxel Model 0.01
	Removal Of Remnants Remove Remnants During Simulation Additional Options Stop simulation on error Disable advanced OpenGL
	OK Cancel Apply Help

CAM Preferences > Simulation

Simulation Model

In the VisualCAM MILL module you can choose between two simulation models. One is called the Voxel Model and the other the Polygonal Model.

Voxel Model

The Voxel Model is a fast simulation model that is primarily used for 3 axis applications. It is especially useful when there are large amounts of toolpath blocks to be simulated. This model is fast but suffers from some accuracy limitations near vertical walls. The display quality of this simulation might also be insufficient for some applications especially when simulating near vertical walls.

Polygonal Model

The Polygonal Model on the other hand is a high quality simulation model. This model uses more accurate simulation algorithms at the expense of speed. The speed of this simulation can be relatively slow when compared to the Voxel Model. Additionally only the Polygonal Model of simulation can be used for 4 and 5 Axis simulations. The Voxel Model is limited strictly to 3 Axis applications.

Note: * This feature is not available in Xpress configuration.

Here is an example of a cylinder stock model representation with Voxel and Polygonal model.

Simulation Mode

You can set the simulation mode to Distance or by Motion. Simulate by Motion simulates the toolpath based on the number of go to motions in the generated toolpath. Simulate by Distance uses a distance based approach.

Note: * This feature is not available in Xpress configuration.

Simulation Speed

You can control the speed of the simulation using the slider bar and the Maximum display interval. When using Simulate by distance mode, the speed is determined as # of Motions / Distance.

Simulation Accuracy

This setting is used to control the accuracy of display of the simulated model. You can control the accuracy of the stock model by selecting from Standard, Medium or Fine. The

finer the stock model accuracy results in slower performance and increases the simulation time.

Use Specified Simulation Spacing for Voxel Model

When Voxel Model is selected (see Simulation Model above), you can also specify the spacing for the Voxel model. Check the box and enter the Spacing distance desired.

Stock Model Simulation Display Transparency

Use this slider to adjust the Stock Model Transparency when the Simulate tab is selected (i.e., when you are performing a cut material simulation).

Removal of Remnants

Check this box to Remove Remnants During Simulation. Any disassociated stock will be removed from the simulation.

Additional Options

Stop Simulation in Error

Check this box to pause the Simulation at each error flag. If enabled, a message will display asking if you wish to continue with the simulation. Selecting Play will simulate to the next error flag and then pause. etc.

Stop Simulation at Error Flag

Disable Advanced OpenGL

Check this box only if you have an older graphics card adapter that does not support advanced OpenGL (i.e., OpenGL 2). Some older cards may only support OpenGL 1 for example. If you experience graphics instability checking this box may help resolve the issue.

4.6.8 User Interface

From here you can set the various user interface options.

Dialog Box: CAM Preferences > User Interface

Preferences	×
Geometry Stock	General User Interface Preferences
Cutting Tools Feeds & Speeds Machining Toolpath Simulation User Interface Licensing	 Show Getting Started Dialog at Startup Run Automatic check for updates at startup Show Configuration Selection Dialog at startup Show Context Tool Tips Show Expression Result in Tool Tip Tool Tip Delay: 0.5 Show Insufficient Machine Axes Warning when Posting

	System ~ OK Cancel Apply Help

Dialog Box: CAM Preferences > User Interface

General User Interface Preferences

User Floating Windows for Mop Dialogs

Selecting this option displays machining operation dialogs as a floating window where the dialog appears on top of the Machining Browser. If the above option is unchecked the machining operation dialog is docked and is displayed over the Machining Browser window.

Show Getting Started Guide at startup

This displays Getting Started dialog at program startup every time the program is loaded. This dialog provides quick access to resources on MecSoft's website.

Run Automatic check for updates at startup

Selecting this option automatically checks for product updates when VisualCADCAM is loaded. This requires access to internet on the computer running VisualCADCAM.

Show Configuration Selection Dialog at startup

Selecting this option displays the product configuration dialog to run when the program is loaded. User can select from the following MILL modules - Standard, Expert, Professional and Premium.

对 MILL	🔞 TURN	🌮 ART	T NEST
Xnress 🗸			

Configuration Selection Dialog at startup

This dialog appears at startup when VisualCADCAM is running in demo mode. Selecting a configuration loads VisualCADCAM and provides the features available in the selected configuration.

Show context ToolTips

Check this box to display Context ToolTips when the mouse moves over a parameter in a dialog. A definition of the parameter will pop-up automatically. Note that Context ToolTips may not be available for ALL dialogs. You can also set the ToolTip Delay in seconds. This is the amount of time it takes to display the Context ToolTip when the mouse activate it.

Show Expression Results in Tooltip

You can enter expressions in any dialog field that expects a numerical value and the value will be computed and entered automatically. Check this box to pop-up the results of any expressions in a ToolTip balloon. An example is shown below.

Location of Cut Geometry
🔿 At Top 💿 At Bottom

Cut Depth Control
Total Cut Depth: 1/2
Rough Depth: 0.5 • • • • • • • • • • • • • • • • • • •
Show Expressions in ToolTip

Show Insufficient Machine Axis Warning when Posting

With this checked, you will receive a warning message if the Machine Setup definition is not set to the required number of axis for the operation being posted.

Show Load Settings from File dialog when open file

CAM Preferences are saved individually with each part file. Check this box to display the Load Settings from File dialog when a file is opened. This gives you opportunity to NOT have your CAM Preferences overwritten by the opened file.

Load settings from file		
This file contains CAM system preferences. Would you like to use them?		
Do not show this dialog again. Yes No		

Load settings from file

Stock Information Dialog Display

Invoke 'Stock Model Information' dialog The Stock Model Information dialog is displayed when a stock geometry is created.

Dialog Box: Stock Model Information

You can turn off this dialog by selecting Do not show this dialog again located on the bottom of the message window.

To display this dialog during stock creation, select CAM Preferences > User Interface and select Invoke 'Stock Model Information' dialog.

Invoke 'Run Simulation After Regeneration' dialog

This dialog is displayed when you regenerate a Setup or the Machining Job.

In Simulation After Regeneration	Ŀ	×
Run simulation after regenerating ea	ach Machinging Operation	
Do not show this dialog again	ОК	

Dialog Box: Run Simulation After Regeneration

Run simulation after regenerating each Machining Operation

Selecting this option simulates every machining operation in the Setup after the operation is regenerated. This is generally selected when a re-roughing operation is part of a Setup as it requires the in-process stock of the previous roughing operation to generate the re-roughing toolpath.

This process would take longer processing time to regenerate all operations in a Setup depending on the system resources and simulation preferences.

To display this dialog when regenerating a Setup, select CAM Preferences > User Interface and select Invoke 'Run Simulation after Regeneration' dialog.

Invoke 'Stock from Selection Information' dialog

This dialog is displayed when creating Stock geometry using Stock from Selection.

Dialog Box: Stock from Selection Information

To display this dialog again when creating Stock from Selection select CAM Preferences > User Interface and select Invoke 'Invoke Stock from Selection Information' dialog.

Ribbon Style

This allows the selection of different themes that changes how the Browser windows appear. The borders, colors, highlighting, and shadowing of standard buttons, dialogs, and windows are controlled by which theme is selected.

Example Ribbon Style: Office 2010 Silver

4.6.9 License

This dialog allows you to set Licensing Preferences for using a Proxy Server and/or a LAN Daemon (for Network Licenses). This information would be provided by your network administrator.

Preferences	×

(OK Cancel Apply Help

Dialog Box: License Preferences

Proxy Server Settings

Proxy Server Settings need to be set if your computer or network is behind a proxy. A proxy server is a computer that acts as an intermediary between the user's computer and the Internet. It allows client computers to make indirect network connections to other network services.

Using Proxy Server

Check this box to enable Proxy Server Settings and complete ALL of the following fields accurately. This information would be provided by your network administrator.

Proxy IP

This is the IP Address for your Proxy Server. This information would be provided by your

network administrator.

Proxy Port

Enter the Port Number for your Proxy Server. This information would be provided by your network administrator.

Proxy User

Enter the Proxy Server user name. This information would be provided by your network administrator.

Proxy

Enter your Proxy Server password. This information would be provided by your network administrator.

LAN Daemon Settings (for Network Licensing)

LAN Daemon Settings are used for Network licenses. On each client machine you would need to enter the following information in the fields provided.

Using LAN Daemon

Check this box to enable LAN Daemon Settings and complete ALL of the following fields accurately. This information would be provided by your network administrator. <u>DO NOT</u> check this box if you are running a node-licked license. *Node-locked* refers to a single user license.

The following message is displayed when this box is unchecked:

Daemon IP

This is the IP Address of the server that hosts the license server. This information would be provided by your network administrator.

Daemon Port

Enter the port # being used by the license server. This information would be provided by your network administrator.

Daemon User Name

Enter the user name used to set up the account on the license server. This information would be provided by your network administrator.

Daemon

Enter the password used to set up the account on the license server. This information would be provided by your network administrator.

✓ Network Authentication Service Settings

Network authentication is a security process required when a computer on a network tries to connect to the server in order to use its resources. If the user's identity has been stored by the server, entering a valid username and password completes the connection.

Using Network Authentication

Check this box to enable Network Authentication. Then complete the Service Server Settings provided here.

Server IP Address

For Network Authentication, enter the Service Server's IP Address here.

Server Port

For Network Authentication, enter the Service Server's Port # here.

Troubleshooting and Messages

Here are some troubleshooting messages that you may encounter.

If you have node locked license activated and you select Using Lan Daemon, this will display the following message and release your node locked license.

If Using Lan Daemon is checked and you are entering a valid node locked activation code in the license dialog, the following message is displayed. Make sure Using Lan Daemon is unchecked before activating a node-locked license.

Machining Methods

The Profile-NEST module includes the one most used 2½ Axis machining method, 2½ Axis Profiling. In Profile-NEST, this operation includes all of the same parameters available within the MILL module.

5.1 2 Axis Profiling

This method machines open and closed regions by tracing along one side of their contours. You can define offsets so that the tool makes multiple passes relative to the regions. Profiling can be used as a finishing operation after a Pocketing or Facing toolpath, or it can be used alone.

2½ Axis Profiling Operation Example

An example of the Profiling toolpath is shown below:

2¹/₂ Axis Profiling Stock Simulation Example

The stock simulation:

2½ Axis Profiling Stock Simulation

Create Machining Operations

Creating machining operations in the Profile-NEST module is a very simple process. You load the part, the stock geometry if necessary, selects a tool, and specify the feeds and speeds to be used in the Profiling operation. Generation of the toolpath begins when you select Generate from the Profiling operation dialog. Once generated the Profiling operation will be created and displayed under the Machining Job in the Machining Operations (Mops) Browser. It is also displayed graphically on the screen.

6.1 Machine Tool Setup

Machine This option on the Program tab allows you to manually setup your Machine Tool Definition.

Machining Browser: Machine Menu Item

The dialog can be displayed by selecting Machine from the Program tab.

6.1.1 Manual Definition

This dialog allows you to setup your Machine Tool Definition. Refer to each section below for more information.

Machine Tool Definition

Manual Definition

This option allows you to manually setup your Machine Tool Definition. Refer to each section below for more information.

Machine Tool Setup	\times
Machine Tool Coordinate System Machine Tool Definition	
Manual Definition Load From File	
Machine Type Number of Axes 3 Axis ~	
General Parameters Tool Change Pt: X 0 Y 0 Z 0 K Output all coordinates in local Setup Coordinate System	
Translational Limits	
Min: X -5000 ♀ Y -5000 ♀ Z -5000 ♀ 5 Max: X 5000 ♀ Y 5000 ♀ Z 5000 ♀ 5	
4th Axis (Primary Axis) Parameters	Ų

See Load From File, Machine Tool Setup for more information.

Dialog Box: Machine Tool Setup - Manual Definition

Machine Type

Number of Axis

• Select 3 Axis for both 2½ and 3 Axis machining methods.

General Parameters

For all Machine Types, the following General Parameters are available.

General Parameters			
Tool Change Pt: \times	0 🗘 Y	0 🕴 Z 🛛	÷ 13
🗹 Output all coordi	nates in local Setu	up Coordinate Syste	em
		Transl	ational Limits
Min: X -200	🜩 Y -200	≠ Z •200	÷ 13
Max: X 200		≠ Z 200	-

Tool Change Point

To define a Tool Change Point, specify a coordinate location in X, Y and Z. or use the Pick button to select a point from your 3D model. The MILL module will output this coordinate location for every tool change. Note that the tool change variables must be configured in the Post Processor.

Output all coordinates in local Setup Coordinate System

Check this box if the G codes need to be output in the Machine Coordinate System (MCS) setup. Uncheck this box to output the G-code in the World Coordinate System (WCS).

Translational Limits

This will be the Minimum X and Maximum XYZ direction Translation Limits allowed by your machine tool. Note: These parameters are not applied and are reserved for future use.

This will be the Minimum X direction Translation Limit allowed by your machine tool. Note: These parameters are not applied and are reserved for future use.

6.2 Profile-NEST Geometry

6.2.1 Part Geometry

Part Geometry is the CAD design geometry that exists in the part file. This design data could consist of both 2D and 3D data. Part geometry is utilized in the computation of toolpaths in the module. Geometry is used in utilized differently in each of the machining operations in MILL.

2½ Axis Profile Typically uses 2D wireframe geometry. 3D wireframe geometry is used in some operations and the 3D surface and/or mesh data as well as the 3D features can be optionally used for certain computations.

6.2.2 Stock Geometry

6.2.2.1 Box Stock

Stock -

You can define the raw stock model as a simple box by selecting the Box Stock option from the Stock menu under the Program tab in Machining Browser.

Machining Browser: Box Stock menu item

Machining Browser: Box Stock menu item

Box Stock Dialog

Use this dialog to define your box stock. Corner position and dimension parameters are provided. Refer to the parameters below. When you pick OK, a stock model based on your definition will be created and displayed.

Box Stock Dialog

Starting Corner

Select a location from the dialog image to use as the origin to measure your stock from. For example:

Set the Bottom South West corner of the Stock should serve as the origin to measured from. The Stock shown on your display will dynamically update accordingly.

Corner Coordinates

Alternatively, you can enter the world coordinates to determine where the corner of the Stock Box should be located. Your Stock Dimensions will be measured from this coordinate point (Xc, Yc, Zc).

You can use the Pick button to select a point from your drawing or model.

Dimensions

You can use these fields to enter the Length (L), Width (W) and Height (H) of your desired Box Stock.

Copy Model Bounding Box

The system calculates the bounding box extents of the part model and displays the X Y Z Coordinate values under Dimensions L, W and H.

Ignore Wireframe Geometry in Bounds Computation

If you check the box Ignore Wireframe Geometry in Part Bounds Computation, any wireframe geometry in your part will be ignored when calculating the Part Bounds.

Make sure to click Copy Model Bounding Box after you check or uncheck Ignore Wireframe Geometry in Bounds Computation.

6.2.2.2 Part Box Stock

Stock You can define the raw stock model as a simple box that surrounds your part. This option is available from the Stock menu under the Program tab in Machining

Browser.

Machining Browser: Part Box Stock menu item

Machining Browser: Part Box Stock menu item

J Dialog Box: Part Box Stock

The system calculates the bounding box of the part model as the XYZ extents of geometry of the part model. You can then define offsets in any of the three coordinate directions to apply to the computed bounding box. The system will expand the bounding box by the offset amount in each of the coordinate directions. When you click on the OK button, a stock model based on your definition will be created and displayed.

Part Bounding Box Stock	×	
Stock Geometry		
Z offset (z) X offset (x)		
Offsets X I Y O Y Z O Y		
Z Offset Direction ● Both +Z and •Z ○ +Z Only ○ •Z Only		
Ignore Wireframe Geometry in Bounds Computation		
OK Cancel Help		

Dialog Box: Part Box Stock

Offsets

X Offset

Enter the X Offset value for sizing your Part Box Stock. The system will expand the part model bounding box by the offset amount in the +/- X direction.

Y Offset

Enter the Y Offset value for sizing your Part Box Stock. The system will expand the part model bounding box by the offset amount in the +/- Y direction.

Z Offset

Enter the Z Offset value for sizing your Part Box Stock. The system will expand the part model bounding box by the offset amount in the +Z direction.

Z Offset Direction

Both +Z and -Z / +Z Only / -Z Only

You can choose to apply the Z Offset value entered in this dialog to either the +Z direction, the -Z direction or both +Z and -Z directions.

Ignore Wireframe Geometry in Bounds Computation

Check this to ignore all 2D and 3D curve geometries present in the part from stock bounding box computation.

6.2.2.3 Delete Stock

You can delete the stock geometry by selecting Delete Stock from Create Stock Model under the Program tab in Machining Browser. The stock model can also be deleted by selecting the stock entry under Machining Job, right mouse button click and select Delete Stock.

Machining Browser: Delete Stock menu item

Delete Stock Menu Item

6.3 **Operations to Nest (Setup)**

🔯 This icon allows you to modify the orientation of the Operations to Nest Setup (referred to as the Machine Coordinate System or MCS) in relation to the Work Coordinate System (WCS), the active Construction Plane or another curve or surface.

Coordinate Systems Triad Displays

The Operations to Nest Setup (MCS) is displayed on your screen as a triad Blue representing the Z-axis, Red representing X-axis and Green representing the Y-axis. The WCS (World Coordinate System) is displayed the same way as but with XYZ axis letters labeled on top of it. These are shown below.

The Default Operations to Nest Setup (MCS)

When the Profile-NEST module is loaded a default Operations to Nest Setup (MCS) is defined for you that is aligned with the World Coordinate System (WCS).

To Modify the Default Setup Orientation

In PRO and higher configuration, the orientation of the default Operations to Nest Setup (MCS) can be modified by double-left-clicking on the Setup icon to load the Setup dialog (shown below).

Double-left-click to Edit Setup

Editing an Operations to Nest Setup (MCS) displays the Setup dialog. This dialog allows you to modify that Setup orientation.

Setup	×
Define Setup Orientation	
Align to	
Machine Coordinate System Active Construction Plane	
Geometry	
Select Surface: 🔖 Select Planar Curve: \	
Set Orientation parallel to	
World X World Z	
Rotate about	
Spin Angle: 90 🔺 X Axis Y Axis Z Axis	
Reset to Original	
Generate Cancel Save Help	

Dialog Box: Setup, Define Setup Orientation tab

Align to

Use the controls in this section to align the Z Axis of the Operations to Nest Setup (MCS).

Machine Coordinate Syste	m Active Construction Plane
Geometry	
Select Surface: 😽	Select Planar Curve: 😽

Machine Coordinate System

This will orient the clearance plane parallel to the defined Setup XY (Work Coordinate system).

Active Construction Plane

This will align the new Setup Coordinate System to the active view's Construction Plane (C-Plane).

Select Surface

Use this option to align to a selected surface. The surface can be selected by using the Pick button.

Select Planar Curve

Use this option to Align To a selected curve. The curve can be selected by using the Pick button.

Set Orientation Parallel To

Use the controls in this section to align the Z Axis of the Operations to Nest Setup (MCS) to one of the WCS (World Coordinate System) axes.

-Set Orientation parallel to

WorldX	World Y	World Z
wond	wond t	wonaz

For the Set Orientation parallel to options, you can select either the World X World Y or World Z buttons to along the MCS parallel to the select axis.

Rotate About

Use the controls in this section to rotate one axis or the Operations to Nest Setup (MCS) incrementally by a defined Spin Angle.

Note: One click of either of these Axis buttons rotates the that setup axis by one increment.

-Rotate about					
Spin Angle:	90	▲ ▼	X Axis	Y Axis	Z Axis

Spin Angle

This is the incremental Spin Angle that is applied when the either the X Axis, Y Axis or Z Axis buttons are selected from this dialog. The spin angle can be positive or negative.

X Axis

Rotate the Machine Tool Coordinate System one Spin Angle increment about the X Axis. Each pick of this button rotates one Spin Angle increment.

Y Axis

Rotate the part one Spin Angle increment about the Y Axis. Each pick of this button rotates one Spin Angle increment.

Z Axis

Rotate the part one Spin Angle increment about the Z Axis. Each pick of this button rotates one Spin Angle increment.

Pick Reset to Original to reset the MCS orientation to the current WCS orientation.

L Things to Remember about Setups

I Setups cannot be edited in Xpress, Standard and Expert configurations.

Selecting Setup edits the default Setup in Professional and Premium configurations.

6.4 Align Stock

Align It is typical to need the ability to position stock geometry in some geometric relationship with the part geometry. A typical scenario is that you have modeled the part with a pre-determined origin. In such cases it would be desirable to locate the stock with respect to the already positioned part without having to go through actually calculating the transformation delta values.

Machining Browser: Align Stock menu item

This dialog can be invoked by selecting Align and Align Stock from Program tab under the Machining Browser.

Machining Browser: Align Stock menu item

Dialog Box: Align Part and/or Stock Geometry

Once both part and stock geometry are loaded, use this dialog to perform the relative positioning. Both Z and XY alignment of different faces of the part with respect to the stock are possible. Select the necessary alignment options using the appropriate radio buttons in this dialog.

Align Part and/or Stock Geometry

Specify the XY Alignment of the Stock to be at the Mid East of the part. The Stock preview will be dynamically updated on your screen.

South West

Specify the XY Alignment of the Stock to be at the South West of the part. The Stock preview will be dynamically updated on your screen.

South

Specify the XY Alignment of the Stock to be at the South of the part. The Stock preview will be dynamically updated on your screen.

South East

Specify the XY Alignment of the Stock to be at the South East of the part. The Stock preview will be dynamically updated on your screen.

Ignore Wireframe Geometry in Bounds Computation

If you check the box Ignore Wireframe Geometry in Part Bounds Computation, any wireframe geometry in your part will be ignored when calculating the Part Bounds.

6.5 Set World CS

You can set the location of the World Coordinate System (WCS) origin with respect to the geometry. An alternative way of thinking about this is to transform all loaded geometry to an appropriate location. This Locate WCS dialog offers you a variety of ways of accomplishing this.

☐ Machining Browser: Set World CS menu item

This dialog can be invoked by selecting Align and Set World CS from the Nest tab under the Machining Browser.

Machining Browser: Set World CS menu item

Dialog Box: Locate World Coordinate System

The Locate WCS dialog appears as shown below

Locate World Coordinate System	×
Locate WCS with respect to Part or Stock	
Set WCS Origin	
Pick Set to Stock Box Set to Part Box Zero Face	
Highest Z O Mid Z O Lowest Z	
Zero Position North West North North East West Center East South West South South East	
× 0 ♠ Y 24 ♠ Z 0.25 ♣ &	
OK Cancel Help	

Set WCS Origin

You can set the origin by explicitly picking a point or can set it with respect to the Part or Stock geometry bounding boxes.

Pick

If you select the Pick option, the button with the pick cursor close to the bottom of the dialog will be activated. You can then click on this button to graphically select a point to align the WCS origin to.

X/Y/Z/Pick

You can set the X, Y, Z values of the WCS (World Coordinate System) manually here. Optionally, you can select the Pick button to select a point. It's XYZ coordinate values will be added to this dialog.

Set to Stock Box

Selecting this item will activate the Zero Face and the Zero Position sections of the dialog. You can then select the Z and the XY locations, with respect to the bounding box of the stock geometry, by choosing the appropriate selections in the dialog.

Set to Part Box

Similar to the previous selection, selecting this item will activate the Zero Face and the Zero Position sections of the dialog. You can then select the Z and the XY locations, with respect to the bounding box of the stock geometry, by choosing the appropriate selections in the dialog.

Zero Face

Make a selection to locate the Z zero of the WCS. This is referred to as the Zero Face.

Highest Z

This tells the system that the Zero Face should be at the Highest Z location of either the Stock or Part, depending on which Set WCS Origin option is selected.

Mid Z

This tells the system that the Zero Face should be at the Mid Z location of either the Stock or Part, depending on which Set WCS Origin option is selected.

Lowest Z

This tells the system that the Zero Face should be at the Lowest Z location of either the Stock or Part, depending on which Set WCS Origin option is selected.

Zero Position

Make a selection to locate the Zero Position of the WCS. You can select one of the cardinal directions listed below.

North West

Locate the WCS in the XY North West position.

North

Locate the WCS in the XY North position.

North East

Locate the WCS in the XY North East position.

Mid-West

Locate the WCS in the XY West position.

Center

Locate the WCS in the XY Center position.

Mid-East

Locate the WCS in the XY East position.

South West

Locate the WCS in the XY South West position.

South

Locate the WCS in the XY South position.

South East

Locate the WCS in the XY South East position.

6.6 Material

This allows you to assign a Material for Stock geometry. You can select a material from the available list of materials. Each Material has a texture that is applied to the stock geometry and can be displayed during simulation. Material is also used as a variable within the <u>Feeds & Speeds Calculator</u>.

Machining Browser: Material menu item

This dialog can be invoked by selecting Material from Program tab under the Machining Browser.

Machining Browser: Material menu item

Choose Stock Material dialog appears as shown below.

Dialog Box: Select Stock Material

D Material File

This points to file where all materials are defined.

This xml contains the list of materials, texture, feeds and speeds. The file is located under Materials folder in VisualCAM. (C:\ProgramData\MecSoft Corporation\VisualCAM 2018\Materials).

The Materials folder contains the following files

- FeedsSpeedsDataINCH.xml
- FeedsSpeedsDataMM.xml

If part unit is set to Inches, VisualCAM automatically loads FeedsSpeedsDataINCH.xml and when part unit is set to MM, FeedsSpeedsDataMM.xml is loaded.

The material file is an .xml file format, which can be edited using any text editor to add newer materials.

See Feeds and Speeds for information on the format of the material file and adding new materials.

Material

This lists all materials available in the selected Material File. Selecting a Material from the list displays the material name and material texture.

Material Texture

A preview of the Material Texture is displayed for reference.

Material Texture Visibility

Once you have defined a Material, click the Material Texture Visibility icon under Program or Simulate tab in Machining Browser to display the texture applied to the stock model.

Note that the Material texture only displayed when Machining Job or the Operations to Nest is selected from the Machining Browser.

6.7 Work Zero

Work Zero Work Zero defines the work coordinate (part or stock) origin. This is typically done after the MCS orientation is defined under Setup. Work Zero translates the MCS origin from the Setup to the desired location. This can be set to any location on the part or stock geometry.

Refer to Machine Tool Coordinate System for orienting the Machine Coordinate System.

Machining Browser: Work Zero menu item

The Work Zero dialog can be invoked by selecting Work Zero from Program tab under the Machining Browser.

Machining Browser: Work Zero menu item

Dialog Box: Work Zero

Set Work Zero dialog appears as shown below. You can set the origin by explicitly picking a point or can set it with respect to the Part or Stock geometry bounding boxes. Each option is described below.

Work Zero	×
Set Work Zero	
<u> </u>	
◯ Pick ◯ Set to Stock Box ◯ Set to Part Box	
Zero Face	
Zero Position	
North West North North East	
South West South South East	
X 0 + Y 0 + Z 0 + K	
Ignore Wireframe Geometry in Part Bounds Computation	
Output Work Offset Work Offset Register Number: 54	
work onset negister Numbel. 94	
Generate Cancel Save Help	

Dialog Box: Work Zero

Pick

If you select the Pick option, the button with the pick cursor close to the bottom of the dialog will be activated. You can then click on this button to graphically select a point to set the Work Zero to.

¢	Pick OSet I Zero Face	to Stock Box	◯ Set to Part Box
~) Highest Z	⊖ Mid Z	◯ Lowest Z
	Zero Position		
	🔾 North West	 North 	 North East
	🔾 West	🔵 Center	🔾 East
	🔵 South West	🔘 South	🔾 South Eas
>	< 0 ► Y	0 <mark>+</mark> ;	z 0 🗧 😽
	Ignore Wireframe G	eometry in Part	Bounds Computation
	Wo	rk Zero Pick Opt	ion

You can use object snaps located in VisualCAD's status bar to snap to part geometry.

Set to Stock Box

Selecting this item will activate the Zero Face and the Zero Position sections of the dialog. You can then select the Z and the XY locations, with respect to the bounding box of the stock geometry, by choosing the appropriate selections in the dialog.

O Pick	🖲 Set t	o Stock Box	◯ Set to Part Box		
- Zero Fai		⊖ Mid Z	😑 Lowest Z		
Zero Po North Wes	sition h West t	O North	 North East East 		
Sout	h West	South	O South East		
			Bounds Computation		
	Work 2	Zero - Set to Sto	ck Box		

Set to Part Box

Similar to the previous selection, selecting this item will activate the Zero Face and the Zero Position sections of the dialog. You can then select the Z and the XY locations, with respect to the bounding box of the stock geometry, by choosing the appropriate selections in the dialog.

	o Stock Box	Set to Part Box
Zero Face	🔵 Mid Z	😑 Lowest Z
Zero Position North West West	O North	 North East East
O South West X -8.88178 ↓ Y	South	C South East
		t Bounds Computation
Work	Zero - Set to Pa	rt Box

Selecting Ignore Wireframe Geometry in Bounds Computation ignores all 2D and 3D curve geometries present in the part for bounding box computation.

Output Work Offset

This allows you to specify a Work Coordinate Offset number which is then output in the posted code. This is set under Work Offset Register Number.

Work offsets are used to set work piece origin on CNC machines and this is assigned to a register number G54, G55 etc...

🗹 Output Work Offset		
Work Offset Register Number:	54	▲ ▼
Work Zero - Output Work Offset		

For example:

- To output G54, set the Work Offset Register number to 54.
- The Work Offset Prefix "G" is set in the post-processor generator.

Generate

Click Generate and Work Zero is now listed under Operations to Nest and also under Nested Sheets in Machining Browser. The MCS origin is now translated to the specified location.

Work Zero displayed in the Machining Browser

Work Zero Example

In the example shown below Work Zero is set to

- Set to Stock Box
- Zero Face Highest Z
- Zero Position South West

6.8 Machining Regions

Machining Regions also referred to as Control Geometry are curves or surface boundary edges that already exist in your model or separate new curves you create that coexist within your part. Be sure to read the Important Notes below before proceeding.

Important Notes about Machining Regions

Machining Regions must be selected before they can be used in a Profile operation. It should be noted that regions can be created and be present in a part file but if they are not selected in a Profile operation they will be ignored during toolpath computation. So creating a region does not make it active; you must use one of the Selection buttons on the Control Geometry tab of the Profile operation dialog before Generating the toolpath.

Multiple regions can be defined and selected in a Profile operation. This is a very powerful feature and affords you fine control over the manufacturing process.

There are two ways of working with Machining Regions. The first is by creating/deleting regions in a part file. The second is selecting regions from the Profile operation dialog. These are both unique processes and each have independent methods of being invoked.

Machining Region Types by Product Configuration

Machining	Product Configuration				
Region Type	Xpress (XPR)	Standard (STD)	Expert (EXP)	Professional (PRO)	Premium (PRE)
Curve	1	1	1	1	1
Surface Boundary/Edge	1	1	1	1	1
Flat Area	1	1	1	1	1
Avoid Regions		1	1	1	1

Creating Regions

To create regions, make sure the ribbon bar containing the CAD tools is visible. Select Appearance > Toolbars > Command Bar from the main menu to display the ribbon bar. You will be able to create rectangular, circular and polygonal regions using the tools under the ribbon toolbar. Regions can also be extracted from the 3D model using the tools available under Curves tab in the ribbon bar.

Multiple Regions

Multiple and nested regions can be selected, but not regions that intersect. Nested regions are handled according to the following rule: The tool will remain inside an outer region and outside an inner region. A region within an inner region is considered to be an outer region. In the following picture, the shaded areas are where the tool motions occur:

Deleting Regions

Regions can be deleted by selecting them graphically in the display window or by using the Selections pane from the Modeling Aids Ribbon Bar.

Menu Bar

To delete the graphically selected regions, select the right mouse button inside the display window. This will bring up the following pop-up menu. Choose Cut to delete the selected regions. You can also hit the Delete key on the keyboard to delete the active selections.

~	Move	
U	Rotate	
¢	Rotate 3D	
	Scale	
	Mirror	
×	Cut	Ctrl+X
Р.	Сору	Ctrl+C
٩.	Paste	Ctrl+P
	Properties	

Right-click Meu for Geometry Regions

Editing Regions

Also the regions can be edited using any of the commands like Move, Rotate, Scale and Mirror. The transformation can also be accessed from the menu bar. The properties of the regions like layer, color can also be edited using the Properties option (Edit > Properties).

6.8.1 Selecting Curve/Edge Regions

You can select curves & edges as machining regions for any Profile operation. You can pre-select the regions or select the Select Curve/Edge Regions button from the Control Geometry tab of the Profile operation dialog.

Criteria for selecting Regions

- Open and closed curves (Lines, Polylines, Arcs, Circles, Polycurves) can be selected as regions in Profile operations.
- There is no limit on the number of curves that can be selected as regions.
- Closed curves can be nested within each other.

Selecting Regions

Select a Part Region first before selecting an Avoid Region. Regions can be selected using one of the following options:

- 1. Select regions using the Select button on the menu bar.
- 2. Select regions graphically in the display window.
- 3. Select regions when creating or editing a Profile operation from the Control Geometry tab of the operation's dialog box shown below using:

Multiple Selections:

Multiple regions can be selected by pressing the CTRL button. These selected regions can be used to create machining operations. The regions can be unselected using the None option (Select > None).

Chain Selections:

You can automatically select a chain of curves or edges by pressing the <Shift> key while performing a left-click selection. This works with any curves or edges that are connected end-to-end.

Chain Select (<Shift>+Left-click)

6.8.2 Selecting Flat Area Regions

For flat areas, you can select the Select Flat Area Regions button from the Control Geometry tab of the Profile operation dialog. Refer to the example below.

Selecting a Flat area Feature for Profiling

Profiling Toolpath generated for the Flat Area Feature

6.8.3 Selecting Avoid Regions

You can define regions to be avoided by the cutter during machining. These regions will be defined by 2D curves and selected from the Avoid Regions sub-tab of the Control Geometry tab of the Profile operation dialog.

6.8.4 Editing Regions

In order to use machining regions in a Profile operation, they must first be selected and made active. This can be done in several ways.

Types of Regions

Here are the types of machining regions you can choose from:

1. Part Regions

These are part curves that drive the location of the tool. Defined from the Part Regions sub-tab of the Control Geometry tab for each operation.

2. Avoid Regions

These are 2D curve regions to be avoided by the cutter during machining. They are defined from the Avoid Regions sub-tab of the Control Geometry tab for each Profile operation.

Editing Regions

Once a Profile operation is created, new regions can be selected or existing regions can be removed from the operation as well.

To edit the list of regions used in an existing Profile operation, expand the folder corresponding to the Profile operation in the Machining Browser window. Then doubleclick on the Control Geometry icon (1) or on the Profile operation folder (2). This will display the Control Geometry tab for that operation.

Now you can edit the list of regions using:

- **Remove All** to remove all the selected regions.
- Move Up/Move Down these allow you to move a selected Drive Region Up or Down in the list
- **Remove Active** by selecting a region from the list of Selected Machining Region(s)
- Select regions using the Select buttons in the dialog.

Displaying Regions

The display of the regions in the part file can be toggled on/off using the layer manager.

Saving/Loading Regions

VisualCAD allows you to save regions in an external ASCII file. Such a file can then be loaded into any part file to generate machining operations. To access the Export and the Import functions look under the File menu bar entry.

Profile Operation Dialog Box: Control Geometry tab

Profile Operation Dialog Box: Control Geometry tab

6.9 Cutting Tools

MILL module allows you to define, use and archive various types of milling and drilling tools. The tool types that are currently supported are Ball, Flat, Corner-radius or bull, VeeMill, Chamfer, Taper, Face, Dove Tail, Fillet, Lollipop, and User Defined.

Tool		Configuration				
Турез		Xpress (XPR)	Standard (STD)	Expert (EXP)	Professional (PRO)	Premium (PRE)
Ball Mills	8	1	1	1	1	1
Flat Mills	X	1	1	1	1	1
Corner Radius Mills	8	1	1	1	1	1
Vee Mills	Ų.	1	1	1	1	1
Chamfer Mills	No.		1	1	1	1
Taper Mills	No.		1	1	1	1
Face Mills	1		1	1	1	1
Dovetail Cutters	1		1	1	1	1
Fillet Mills	Ŵ		1	1	1	1
Lollypop Cutters	Q,		1	1	1	1
User Defined Cutters	?		1	1	1	1

6.9.1 Create/Select/Edit Tools

To create a tool, you either selects the Create/Edit Tool option under the Tools tab in Machining Objects Browser or alternatively by selecting the Create/Edit/Select Tool button under the Tool tab in the machining operation. This brings up the following dialog box that you can utilize to create and edit tool definitions.

Note: See <u>Cutting Tools</u> for a list of tools supported by Profile-NEST.

Create/Select Tools Dialog

Dialog Box: Create/Select Tools

Dialog Box: Create/Select Tools

Create Tools Toolbar

The tool icon bar on the top of the dialog displays the all various types of tools available in MILL module. Different tool types can be defined by selecting the desired icon in the dialog box.

Note: The actual tools that you will see listed in this toolbar will depend on what module and what configuration you are currently running.

Tools in Session

The dialog box shows the tool name of the current selection if there is one selected in the list-box under Tools in Session. If there is no selection then the tool name will be the name used for a new tool definition. The list box itself lists all of the tools of the corresponding type.

Tools in Session

Standard APT Parameters for Tool Definition

The geometry definition of the tool contains edit boxes for the diameter, corner radius, taper angle, flute length and the tool length. These definitions are standard APT parameters for the tool definition. The flute length denotes the cutting length while the tool length denotes the total length of the tool to the tool holder.

Save/Edit/Delete Tool

Save As New Tool

Saves a new tool and lists under Tools in Session. If a tool of same name already exist under Tools in Session, Save as New tool button will be grayed out.

Save Edits to Tool

Saves edits or changes made to tool parameters.

When you Save Edits to Tool, each Mop in the Machining Job tree that uses the Load from Tool option, will be updated with the new feeds/speeds for that tool automatically.

Delete Tool

Deletes the selected tool. A tool will not be deleted a tool if is being used in a machining operation.

Tool Preview

As the tool geometry is defined, a preview of the tool is shown in the graphics window.

1001 Preview

The Properties tab

The Properties tab to the right side of the tool preview allows you to set the Tool Material, the Cut Material Color (for that Tool), Number of Flutes in the tool, Tool Number, Adjust Register, Cutter Compensation Register, Axial Offset, Coolant Type. The Number of Flutes is used in Feeds & Speeds calculations. The tool number is used when post processing toolpaths.

The Cut Material Color selector will allow you to assign colors to each Cut Material created by this tool. set a you Save Edits to Tool, each Mop in the Machining Job tree that uses the Load from Tool option, will be updated with the new feeds/speeds for that tool automatically.

Coolant	None		~
Comments	:		

The Feeds & Speeds tab

The Feeds & Speeds tab located next to Properties tab allows you to set feeds and speeds for each tool.

Refer to the Feeds and Speeds section for additional information.

Cut Depth

You can set the Cut Depth specific for each tool you create. If you set this value here, you will see a Depth From Tool icon next to the Rough Depth/Cut parameter in the Cut Levels tab of each operation where it applies. Selecting the icon will use this value for Rough Depth/Cut. If Cut Depth is left at 0 in this dialog, the icon will not appear in the Cut Levels tab.

Properties Feeds & Speeds
Spindle Parameters Speed 14667 🗬 RPM
Direction CW CCW

Bottom Z Level 100 🔺 %
Cut Depth 0 💌 in
Load from File

The Feeds & Speeds tab

Taper Angle

Taper Angle is set for VeeMill, ChamferMill and TaperMill. This angle is the included angle. For a 60 degree taper tool, the Taper Angle is set as 30.

Taper Angle

Flat Diameter Examples

Flat Diameter is set for ChamferMill and TaperMill. When Flat diameter is set =0, the tip converges to a point.

To define a ball mill with taper, set Flat diameter = 0 and Corner Radius = tool radius.

In the example shown below, Flat Dia = 0 and Corner Radius = 0.25. This creates a 0.5" ball mill with a 10 degree taper.

Properties tab for Taper Mill

Taper Mill

In the example shown below, Flat Dia = 0.5 and Corner Radius = 0.25. This creates a taper tool with a 10 deg taper angle, 0.5" flat diameter and 0.25" corner radius.

Properties tab for Taper Mill

6.9.1.1 Feeds & Speeds

6.9.1.1.1 FS Calculator

This loads the Feeds & Speeds values from the Feeds & Speeds Table file. This will display the Load Feeds from Table dialog box to make your selections.

Dialog Box: Load Feeds from Table

Selecting OK from this dialog transfers the spindle speed and cut feedrate to the Feeds & Speeds tab. The plunge, approach, engage, retract and departure feeds are determined using a percent of the cut feed. The percent to use for transferring the computed cut feed can be set under Feeds & Speeds Preferences.

Dialog Box: Load Feeds from Table

Data from Table

These selections and calculations are defined in a feeds and speeds data file which can be edited to add newer materials. See our blog post <u>How to Customize Materials Data</u> <u>for Feeds & Speeds Computation</u> for more details.

Stock Material

Select the desired Stock Material from this list to use in Feeds/Speeds calculations.

Tool Material

Select the desired Tool Material from this list. CARBIDE, HSS CERAMIC are supported. The material is used in the tool's Feeds/Speeds calculations.

Surface Speed

Selecting a Stock Material and Tool Material displays the Surface Speed and Feed/Tooth. This information is contained in a feeds and speeds data file which can be edited to add newer materials.

Feed/Tooth

Selecting a Stock Material and Tool Material displays the Surface Speed and Feed/Tooth. This information is contained in a feeds and speeds data file which can be edited to add newer materials.

Input Variables

The input variables Tool Diameter and Number of Flutes are automatically loaded based on the tool selected for the operation. Based on these parameters, the program computes Spindle Speed and Cut Feedrate. Changing the Spindle Speed modifies the Cut Feedrate.

Maximum Limits for Computation

Here you can set the Max Spindle Speed and Max Cut Feed (Cf) values. Once these two values are set, the Spindle Speed and Cut Feed calculated by this dialog will not exceed these values even if you attempt to enter higher values into the Computed Variables fields. To exceed these values, change them here or you must edit the operation or tool parameters manually. This value <u>WILL NOT</u> exceed the High Value set in your current post-processor selection. To do so you must edit the post using the Post-Processor Generator (Program tab > Post > Current Post Processor > Edit > Feedrate > High Value).

Computed Variables

The variables for Spindle Speed and Cut Feed (Cf) are computed for you based on the selections made in this dialog but will not exceed the values set in the Maximum Limits for Computation section of the dialog. These values are then assigned to the active toolpath operation or tool. You can override either of these variables and the other will update automatically. Since this dialog is a Feeds & Speeds Calculator, you cannot override both values. To do so, you must edit the operation or tool parameters manually.

6.9.2 Load Tool Library

This allows you to load a previously saved tool library.

From the Tools tab of the Machining Objects Browser, select the Load Tool Library button

Note: The actual icons you see in this dialog will depend on what module and what configuration you are currently licensed to operate.

Tools
Error Load Tool library
No Sort 🔹 🏞 🐼

Machining Objects Browser, Load Tool Library

- 2. Browse to the folder, double click on the desired file to load it into Profile-NEST module. The folder of the last loaded tool library is displayed by default.
- 3. The loaded tool list will be seen under the tool button in the Machining Objects Browser.

Tools	5

The loaded tool list will be seen under the tool button in the browser

4. To perform the Edit, Rename, Cut, Copy or Paste operations on any of these tools, hit the right mouse button while highlighting the desired tool.

6.9.3 Unload Tool Library

This allows you to unload the current Tool Library. From the Tools tab of the Machining Objects Browser, select the Unload Tool Library button.

Note: The actual icons you see in this dialog will depend on what module and what configuration you are currently licensed to operate

6.9.4 Add Tool Library

You can right-click on a Tool listed in the Mobs Browser to Add the Tool to an exiting Tool Library *.csv data file.

Note: The actual icons you see in this dialog will depend on what module and what configuration you are currently licensed to operate

Add Tool to Library

6.9.5 Select Tool from Library

This allows you to select tools from a previously saved tool library.

 From the Tools tab of the Machining Objects Browser, select the Select Tools from Library button

Note: The actual icons you see in this dialog will depend on what module and what configuration you are currently licensed to operate

From the Tools tab of the Machining Objects Browser, select the Select Tools from Library button.

2. The list of tools will now be displayed under Select Tools(s) from list dialog and you can drag and drop the tools from the selection list to the cutting tools browser.

The list of tools will now be displayed under Select Tools(s) from list dialog.

3. To Edit, Rename, Cut, Copy or Paste on any of these tools, use right mouse button click after selecting the tool under Tools tab.

Right-click to edit a Tool in your Tool List

6.9.6 Save Tool Library

This allows you to Save your tools to a Tool Library file. The file can be saved in the desired directory and read in when required.

1. From the Tools tab of the Machining Objects Browser, select the Save Tool Library button

Note: The actual icons you see in this dialog will depend on what module and what configuration you are currently licensed to operate

From the Tools tab of the Machining Objects Browser, select the Save Tool Library button

2. Use the File Save As dialog box to save the Tool Library file. The folder of the last saved tool library is displayed by default.

File Types Supported: MILL Module supports *.vkb and *.csv. tool library file formats. Both formats save and load tools with the feeds and speeds assigned for each tool.

3. Specify a file name and click Save.

6.9.7 List Tools

This allows you to List and Print your tools.

1. From the Tools tab of the Machining Objects Browser, select the List Tools button

Note: The actual icons you see in this dialog will depend on what module and what configuration you are currently licensed to operate

From the Cutting Tools Information dialog box, you can view or Print your Tool List

3. Pick OK to close the dialog.

6.9.8 User Defined Tools

Available in:	Xpress	Standard	Expert	Professional	Premium

The MILL module allows creation of special purpose tools like form tools. These can be defined under user defined tool in the create/select tool dialog.

 User Defined Tools can be used in Drill operations to allow multifunction tools to be defined as user defined tools and used in drilling operations. See User Defined Tools for more information.

Steps to create a user defined tool

Steps to create a user defined tool

Steps to create a user defined tool:

- 1. Draw half the tool profile from the top view (XY plane of the world coordinate system) as shown in the picture above.
- 2. Make sure one end of the curve (tool tip) is at origin (0,0) and the other end at X0, Y<value>.
- 3. From the Tools tab under the Machining Objects Browser, click Create/Select Tool and select User Defined Tool.

click Create/Select Tool and select User Defined Tool

4. Click Load selected tool profile curve.

Click Load selected tool profile curve

5. Specify the Holder Diameter, Holder Length, Properties, Feed & Speeds and Click Save as New Tool.

Preview your Tool

Preview Tool allows you to preview the highlighted tool in the workspace as seen below. The tool is previewed at the WCS origin.

Preview your Tool

6.9.9 Cutter Compensation

Cutter Compensation is used typically to compensate for the difference in the dimensions of the actual cutter used in machining and the cutter used for programming in MILL module. For example, if the cutter used in programming in MILL module is 0.25 inches and due to tool wear the actual cutter is only 0.24 inches in size, you can compensate for this in the controller rather than having to re-program the operation again. Refer to the 2½ Axis Control Matrix for information about which toolpath operations support Cutter Compensation.

Enabling Cutter Compensation

To do this you need to do the following:

1. Turn cutter compensation on in the Operation Set Compensation to Auto/ON or Control/ON.

Note: Setting the Compensation to Auto/ON or Control/ON has the same behavior in MILL module.

2. Specify the cutter compensation value and the compensation register in the controller (the controller needs to be capable of doing this)

A few things to watch out for:

Cutter compensation makes sense only in 2-1/2 axis operations. If you are using roughing (pocketing and facing) the compensation will be turned on only in the final passes.

Make sure you are not using Zig-Zag cut traversal in any of the methods that you want to turn compensation on.

Make sure you have a linear motion for the controller to turn on the compensation value on. If your first motion is an arc the controller will not be able to turn on the compensation. Thus, in 2-1/2 axis profiling, make sure there is a linear entry motion for the controller to be able to turn compensation on.

Select the Post Processor from the Post Processor generator

Select the Post Processor from the Setup tab in Machining Browser by selecting Utilities and Post Processor generator.

6.10 Feeds and Speeds

The following Feeds & Speeds tab is displayed for all Mill operations. It allows you to select the appropriate Feeds & Speeds for the current Mill operation. In this tab, Spindle Parameters and Feed Rates can be specified. Speeds & Feeds can also be loaded from a File or from the Tool.

Feed Rates Explained

Feed Rate is one of the most important factors to consider when implementing any CNC strategy. Simply put, feed rate is the speed at which the cutter engages the part and is typically measured in units/minute. Suggested cut feed rates will vary depending on the

type of material you are cutting (i.e., aluminum, steel, wood, acrylic, etc.), the material of the cutter (carbide, high speed steel, ceramic, etc.) and many other cutting factors including desired surface and the characteristics of the CNC machine itself.

Dialog Box: Feeds & Speeds tab,2 Axis Drag Knife

Spindle Parameters

These parameters refer to the spindle on your machine.

Spindle Speed

This is the rotational Speed (S) of the milling spindle expressed in RPM.

Spindle Direction (CW)

This sets the spindle rotation to be Clockwise (CW).

Spindle Direction (CCW)

This sets the spindle rotation Direction to be Counter Clockwise (CCW).

Feed Rates

These are the feedrates (in Units/Min) that will be applied to the current toolpath operation. If the values are currently populated from your Tool definition (Load from Tool), Feeds & Speeds table (Load from File) or from your Knowledge Base, you can override them for this operation.

Plunge (Pf)

This is the rate is the feed before the tool starts to engage in material. This is always vertical.

Approach (Af)

This is the Approach (Af) feedrate (in Units/Min) used to prepare the cutter just before it starts to Engage into material for cutting. Approach motions are dependent on the method of machining.

Engage (Ef)

This is the Engage (Ef) feedrate (in Units/Min) used when the tool is Engaging the material just prior to cutting.

Cut (Cf)

This is the Cut (Cf) feedrate (in Units/Min) used when the tool is Cutting material.

Retract (Rf)

This is the Retract (Rf) feedrate (in Units/Min), when the tool is performing a Retract move away from material.

Departure (Df)

The is the feedrate (in Units/Min), when the tool Departs from the material.

Transfer (Tf) Use Rapid

This is the Transfer (Tf) feedrate (in Units/Min) used for Transfer motions. If you select Use Rapid the posted G-Code will output a rapid motion (G0) with no feed rate. Note: For more accurate machining time estimates, use the Set option and enter the feed rate to use.

Transfer (Tf) Set

This is the Transfer (Tf) feedrate (in Units/Min) used for Transfer motions. If you select Use Rapid the posted G-Code will output a rapid motion (G0) with no feed rate. Note: For more accurate machining time estimates, use the Set option and enter the feed rate to use.

Feed Rates Reduction Factors (Hole Operations Only)

This section of the dialog allows you to specify Feed Rate Reduction Factors for specific tool motions.

Plunge between levels

This is a percentage of the Cut (Cf) feedrate to use when the tool is plunging between Z levels.

First XY Pass

This is a percentage of the Cut (Cf) feedrate to use on the first XY cut motion when the toolpath uses the full width of the cutter.

Coolant

Here you can override the Coolant that is specified by the Tool. Coolant can be set to Flood, Mist or Through. Coolant codes are defined in the post processor generator under Misc tab.

Load from Tool

Load the Feed & Speeds values that are saved with the currently selected Tool.

See: Create/Edit Tools

Load from File

This loads the Feeds & Speeds values from the Feeds & Speeds Table file. This will display the Load Feeds from Table dialog box to make your selections.

Dialog Box: Load Feeds from Table

Selecting OK from this dialog transfers the spindle speed and cut feedrate to the Feeds & Speeds tab. The plunge, approach, engage, retract and departure feeds are determined using a percent of the cut feed. The percent to use for transferring the computed cut feed can be set under Feeds & Speeds Preferences.

Dialog Box: Load Feeds from Table

Data from Table

These selections and calculations are defined in a feeds and speeds data file which can be edited to add newer materials. See our blog post <u>How to</u> <u>Customize Materials Data for Feeds & Speeds Computation</u> for more details.

Stock Material

Select the desired Stock Material from this list to use in Feeds/Speeds calculations.

Tool Material

Select the desired Tool Material from this list. CARBIDE, HSS CERAMIC are supported. The material is used in the tool's Feeds/Speeds calculations.

Surface Speed

Selecting a Stock Material and Tool Material displays the Surface Speed and

Feed/Tooth. This information is contained in a feeds and speeds data file which can be edited to add newer materials.

Feed/Tooth

Selecting a Stock Material and Tool Material displays the Surface Speed and Feed/Tooth. This information is contained in a feeds and speeds data file which can be edited to add newer materials.

Input Variables

The input variables Tool Diameter and Number of Flutes are automatically loaded based on the tool selected for the operation. Based on these parameters, the program computes Spindle Speed and Cut Feedrate. Changing the Spindle Speed modifies the Cut Feedrate.

Maximum Limits for Computation

Here you can set the Max Spindle Speed and Max Cut Feed (Cf) values. Once these two values are set, the Spindle Speed and Cut Feed calculated by this dialog will not exceed these values even if you attempt to enter higher values into the Computed Variables fields. To exceed these values, change them here or you must edit the operation or tool parameters manually. This value <u>WILL NOT</u> exceed the High Value set in your current post-processor selection. To do so you must edit the post using the Post-Processor Generator (Program tab > Post > Current Post Processor > Edit > Feedrate > High Value).

Computed Variables

The variables for Spindle Speed and Cut Feed (Cf) are computed for you based on the selections made in this dialog but will not exceed the values set in the Maximum Limits for Computation section of the dialog. These values are then assigned to the active toolpath operation or tool. You can override either of these variables and the other will update automatically. Since this dialog is a Feeds & Speeds Calculator, you cannot override both values. To do so, you must edit the operation or tool parameters manually.

The Milling Feeds & Speeds Calculator

Did you know that MecSoft's MILL Module plug-ins have a built-in Feeds & Speeds Calculator? That's right, you can ask the program to suggest feeds & speeds values based on your current stock material and active tool parameters! Once a Cut Feed is calculated, you can then choose to automatically assign feed rate values for the various toolpath motions in your operation including Plunge, Approach, Engage, Retract and Departure! The percentages of the Cut Feed to assign are all controlled from the CAM Preferences dialog. The Milling Feeds & Speeds Calculator...

Read the full article...

Customizing Feeds & Speeds

MILL module allows you to customize the feeds and speeds based on the stock material being machined, the material of the cutter employed and also the operation type. This is done by archiving your desired feeds and speeds settings in an external data file.

A default implementation of this table has been included with the VisualCAM product and can be found in a folder called "Materials" under the product installation directory.

This xml contains the list of materials, texture, feeds and speeds. The file is located under Materials folder in the VisualCAM install directory. (C:\ProgramData\MecSoft Corporation\VisualCAM 2020\Materials).

Materials folder contains the following files

- FeedsSpeedsDataINCH.xml
- FeedsSpeedsDataMM.xml

The Feeds and speeds file is an .xml file format, which can be edited using any text editor to add newer materials. These values can then be recalled at any time to compute the feeds/speeds to be used in the current program.

The format for this file is shown below.

<units>Imperial</units>
<feedsspeeds></feedsspeeds>
<material></material>
<name>Stock Material</name>
<texturefile>Texture Bitmap</texturefile>
<feedsspeedsrecord>Operation type, Tool Material,</feedsspeedsrecord>
Surface Speed, Feed per Tooth

An example entry is shown below.

<Material>

<Name>ALUMINUM - 2024</Name> <TextureFile>ALUMINUM.bmp</TextureFile> <FeedsSpeedsRecord>MILLING, CARBIDE, 1600.00, 0.0040</FeedsSpeedsRecord> <FeedsSpeedsRecord>MILLING, HSS, 400.00, 0.0040</FeedsSpeedsRecord> <FeedsSpeedsRecord>MILLING, CERAMIC, 400.00, 0.0040</FeedsSpeedsRecord> <FeedsSpeedsRecord>DRILLING, CARBIDE, 960.00, 0.0048</FeedsSpeedsRecord> <FeedsSpeedsRecord>DRILLING, HSS, 240.00, 0.0048</FeedsSpeedsRecord> <FeedsSpeedsRecord>DRILLING, CERAMIC, 240.00, 0.0048</FeedsSpeedsRecord> <FeedsSpeedsRecord>DRILLING, CERAMIC, 240.00, 0.0048</FeedsSpeedsRecord> <FeedsSpeedsRecord>TURNING, CARBIDE, 1800.00, 0.0200</FeedsSpeedsRecord> <FeedsSpeedsRecord>TURNING, CERAMIC, 1800.00, 0.0200</FeedsSpeedsRecord> <FeedsSpeedsRecord>TURNING, CERMET, 1800.00, 0.0200</FeedsSpeedsRecord> </Material>

> If part unit is set to Inches, MILL module automatically loads FeedsSpeedsDataINCH.xml and when part unit is set to MM, FeedsSpeedsDataMM.xml is loaded.

More on Customizing Materials Data

Note: This blog post is intended for advanced users who are familiar with XML text editing and have administrative access to their Windows Operating System. MecSoft's CAM plug-ins have a built-in Feeds & Speeds Calculator that can suggest Spindle Speeds and Cut Feed Rates based on your stock material and active tool parameters! However, what if you are cutting stock material that is currently not in our Materials Library? Or what if you don't like what is currently assigned for the material of your choice in the

Materials Library? This post will show you how to customize MecSoft CAM to add and manage multiple material files as well to add your own stock materials. If you are new to MecSoft's CAM plug-ins, you can review my earlier post on the Feeds & Speeds Calculator and how it works.

Dialog Box: Load Feeds from Table

Data from Table

These selections and calculations are defined in a feeds and speeds data file which can be edited to add newer materials. See our blog post <u>How to Customize Materials Data</u> <u>for Feeds & Speeds Computation</u> for more details.

Stock Material

Select the desired Stock Material from this list to use in Feeds/Speeds calculations.

Tool Material

Select the desired Tool Material from this list. CARBIDE, HSS CERAMIC are supported. The material is used in the tool's Feeds/Speeds calculations.

Surface Speed

Selecting a Stock Material and Tool Material displays the Surface Speed and Feed/Tooth. This information is contained in a feeds and speeds data file which can be edited to add newer materials.

Feed/Tooth

Selecting a Stock Material and Tool Material displays the Surface Speed and Feed/Tooth. This information is contained in a feeds and speeds data file which can be edited to add newer materials.

Input Variables

The input variables Tool Diameter and Number of Flutes are automatically loaded based on the tool selected for the operation. Based on these parameters, the program computes Spindle Speed and Cut Feedrate. Changing the Spindle Speed modifies the Cut Feedrate.

Maximum Limits for Computation

Here you can set the Max Spindle Speed and Max Cut Feed (Cf) values. Once these two values are set, the Spindle Speed and Cut Feed calculated by this dialog will not exceed these values even if you attempt to enter higher values into the Computed Variables fields. To exceed these values, change them here or you must edit the operation or tool parameters manually. This value <u>WILL NOT</u> exceed the High Value set in your current post-processor selection. To do so you must edit the post using the Post-Processor Generator (Program tab > Post > Current Post Processor > Edit > Feedrate > High Value).

Computed Variables

The variables for Spindle Speed and Cut Feed (Cf) are computed for you based on the selections made in this dialog but will not exceed the values set in the Maximum Limits for Computation section of the dialog. These values are then assigned to the active toolpath operation or tool. You can override either of these variables and the other will update automatically. Since this dialog is a Feeds & Speeds Calculator, you cannot override both values. To do so, you must edit the operation or tool parameters manually.

6.11 Clearance Plane

The clearance plane is an XY plane wherein all transfer motions between a retract and engage motion takes place. In the case of 4 axis operations, the clearance plane is a cylinder and defined along the axis of rotation. Typically you would define this plane at a certain safety distance above the part geometry. This is done to prevent the tool from touching the part being machined during transfer motions since these motions usually use a very fast or rapid feed rate.

Dialog Box: Clearance Plane tab

Cut Parameters C Control Geometry Clearance Plane Defin Automatic Part Max Z + Disl Stock Max Z + D Absolute Z Value	t 0.25 Dist 0.25 e 0.25	Engage/Retract Feeds & Speed	Advanced Cut Parameters ds Clearance Plane

	e Geometry in	Bounds Computation	
Cut Transfer Method - O Skim Skim Clearance O Clearance Plane	(C) 0	Clear	rance Plane

Dialog Box: Clearance Plane tab, similar for all Milling operations

Clearance Plane Definition

This selection defines the Clearance Plane for the current toolpath operation.

Automatic

Allow the system to calculate a the clearance plane height automatically based on the part and stock geometry.

Part Max Z + Dist

Set the Clearance Plane height to the maximum Z height of the Part plus this added distance.

Part Max + Dist

Stock Max Z + Dist

Select this option to use the Stock's Maximum Z height and then enter a Distance value to add to this for the total Z height for the Clearance Plane.

Stock Max + Dist

Absolute Z Value

Select this to specify the absolute Z clearance height to use and then enter Z height value. Be sure that the value you specify clears your part geometry.

Absolute Z Clearance

Ignore Wireframe Geometry in Bounds Computation

Check this box to ignore all wireframe geometry when calculating the Clearance Plane definition. When checked, the Automatic and Part Max options for defining the Clearance will be calculated from actual surface geometry.

Ignore Wireframe Geometry in Bounds Computation

Cut Transfer Method

This section allows you to control the tool's motions when it needs transfer to another region to begin cutting.

Clearance Plane

Select this option to move the tool to the Clearance Plane and then perform the Transfer motion to the next cut location.

Transfer at Clearance Plane

Skim

Select this option to perform transfer motions at a Skim plane. The system automatically determines a safe height and then adds this Skim Clearance (C) to the computed Z value to perform the Transfer Motions.

Display of Clearance Plane for Milling operations

When the clearance plane dialog is active, specifying a clearance plane definition, displays the clearance plane on the part in the view port.

Display of Clearance Plane for Milling operations

6.12 Tools and Utilities

CAM system Tools and Utilities provides access to G-Code Editor/Analyzer and Post process generator. To access the functions, select the "Utilities" option under the Machining Browser.

📙 Tools & Utilities Menu

CAM System Utilities Menu Item

G-Code Editor/Analyzer ...

Loads the NC editor. By default this is set to notepad. This is specified under Program to send posted file to which can be found in Set Post-Processor Options dialog. Refer to Set Post Options for additional information.

Post Processor Generator ...

This Loads Post Processor Generator utility.

Export to VCP

Export the CAD drawing/model including all CAM data to a *.vcp VisualCAD file.

6.12.1 Shop Docs

This creates a Shop Document (i.e., a Setup Sheet) for the programmed part which includes screen captures, estimated machining time, tool list and the machining operations list as well as stock size and other important information. The document can be saved in HTML or Excel format.

Select Shop Documentation from the Right-click Menu

Shop documentation can be generated by selecting Setup under the Program tab, right click and select Shop Documentation.

The Setup Sheet is Saved and Displayed

You can select from an assortment of HTML Templates and an Excel Template from the Save Shop Documentation File dialog and then pick Save to generate shop documentation. This is saved as an external file and can be printed and handed over to the operator in preparation for the part to be machined on the CNC machine.

Sample Shop Document using Template 2

6.12.2 Toolpath Viewer

Once a machining operation is created, you can step through the toolpath motions using the Toolpath Viewer. To display the viewer, expand the operation folder in the Machining Browser and right-click on the toolpath icon. The toolpath viewer is a dockable dialog bar that will be initially docked below or next to the Machining Browser.

The Toolpath Viewer Displayed

Previewing Setup Information in the Toolpath Viewer

If the Toolpath Editor/Viewer is currently displayed, selecting Operations to Nest will display the setup location and orientation. Errors are flagged and displayed in the toolpath editor/viewer if the setup orientation is not achievable.

Setup Information is displayed in the Toolpath Viewer

Previewing a GOTO Motion in the Toolpath Viewer

Select a GOTO motion in the Toolpath Viewer to view the tool motion for the generated toolpath.

Make sure to turn on ⁶⁶ Toolpath Visibility.

c						>
					F	rint
					F	Print

Dialog Box: Machining Operations Information

Optimize Machining Time Estimates!

In any MecSoft CAM product you can get an Information report about a selected toolpath operation, a Setup or all operations in the Machining Job. This report contains some very useful information that includes the Tool #s used, the Cut Feed, the # of GOTO motions and most importantly, the estimated Machining Time.

Read the full article...

6.12.4 Save as Defaults

Save As Defaults allows you to set default parameters for machining operations. This allows the reuse of the machining parameters without having to enter the same parameters when creating new machining operations on same part or new part files.

To Save As Defaults:

Step 1: Create or Select a Machining Operation

Create or Select a machining operation under the Program tab in Machining Browser.

Step 1: Create or Select a Machining Operation

Step 2: Save As Defaults

Right mouse button click on a machining operation and select Save As Defaults.

🖃 🎁 Machining Job	chining Job						
🥣 💓 Machine - 3 Axis							
🤣 🛛 Post - Laguna_BR	Post - Laguna_BR_IQ						
🚽 😚 Stock - Box Stock	Stock - Box Stock						
Operations to Nest							
	Nesting Parameters						
🗄 🗝 📁 🔁 1/2 Axis Prof	filing (Part 1)						
🕀 📄 😳 2 1/2 Axis P 🍯	Regenerate						
i∃ [] 2 1/2 Axis P i∃ [] 2 1/2 Axis P	Post

	Save As Defaults						
	Properties						

Step 2: Save As Defaults

Step 3: Specify a File Name

This displays a Save As dialog when a default knowledge base is not specified under Set Machining Preferences.

Specify a file name Click Save.

This creates a default knowledge base for the profiling operation and is saved to the DefaultKB.vkb file.

The saved knowledge base is automatically set as the default knowledge base to load under Machining Preferences and the parameters defined in the knowledge base are used when creating a new Profile machining operation.

Default Knowledge Base :	DefaultKB	~			
Source folder for Knowledge	e Base:				
C:\ProgramData\MecSoft Corporation\					

Set Machining Preferences

L Step 4: Things to Remember

- P Save As Defaults can be set for all machining operation types.
- Once a default Knowledge base is specified under Machining Preferences, selecting Save as Defaults appends additional parameters to the same Default knowledge base file.
- If a default for a specific operation type does not exist, the system defaults are used.
- Changing the parameters saving as defaults overwrites the default parameters with the new one.
- Multiple Default Knowledge bases can be created and saved. This could come in handy when machining different types of materials, which requires different cutting parameters. You could create one for machining Steel, Aluminum, Wood, etc...

Step 5: To Create a NEW Default Knowledge Base

To create a new default knowledge base:

1. Under Machining Preferences, change the Default Knowledge Base to Undefined.

Undefined	\sim				
Source folder for Knowledge Base:					
C:\ProgramData\MecSoft Corporation\					
	e Base:				

- 2. Select a machining operation under the Machining Job, right mouse button click and select Save As Defaults.
- Specify a new file name and click Save. The saved knowledge base is now set as the default knowledge base to load under <u>Machining Preferences</u> and the parameters defined in the knowledge base are used when creating a new machining operation.

Only one Default Knowledge base can be loaded at one time. You can change the default knowledge base to load before creating a

new machining operation.

Dialog Box: Post Process Generator

6.12.6 Explode Cabinet Design ...

This utility is ONLY available when the MILL or Profile-NEST module is loaded. You can use this utility to explode and layout a Cabinet Design in preparation for the NEST or MILL modules. In the example below, a Cabinet Design file *Base.skp* (created in SketchUp) was opened in VisualCAD. This utility is then used to explode and layout each planer component in the 3D part. Once the component geometry is exploded, you can arrange them for machining.

Explode Cabinet Design

This utility will be affected by the CAD system's Absolute Tolerance. If you find that one or more geometry groups are not being exploded, try increasing the CAD system's tolerance settings and try again.

Explode Cabinet Design Menu Item

Dialog Box: Component Decomposition Control Parameters

Geometry Selection

You can use this section of the dialog to limit the selection of geometry to explode. You can select from the following:

Explode all visible

This option will select all visible geometry in the file for use with this utility.

Explode only following layers

This option allows you to select only geometry located on certain layers that reside in the file. When this option is selected, all layers present in the file are listed. You can check the box next to the layer(s) whose geometry you wish to select. The Select All and Clear All button can be used to assist in selecting layers.

Explode selected

This option will allow you to select the geometry you wish to explode. With this option selected, select the Pick button and then select the geometry to explode.

Component Placement

These options allow you to control the array placement of components on the XY plane after exploding. Select from the following:

Single row along X

Select this option to arrange all components in a single row in the X direction on the XY Plane. Enter the Spacing between the components (refer to this value below).

Single column along Y

Select this option to arrange all components in a single row in the Y direction on the XY plane. Enter the Spacing between the components (refer to this value below).

Array with fixed distance along X

Select this option to arrange the components along the X direction but at a fixed distance. This means that if the next component exceeds the Fixed Distance a new row is created. Enter the Spacing between components and the Fixed Distance (refer to these values below).

Array with fixed distance along Y

Select this option to arrange the components along the Y direction but at a fixed distance. This means that if the next component exceeds the Fixed Distance a new row is created. Enter the Spacing between components and the Fixed Distance (refer to these values below).

Space between components

These values are available depending on the Component Placement selection above:

Spacing

This is the minimum distance between all components in the layout.

Fixed Distance

This is the maximum distance allowed for the component array. If a component causes this distance to be exceeded it is moved to another row of components.

Output Geometry

These options determine the type of geometry that is created and on what layer they are placed. Select from the following:

Create both 3D geometry and 2D curves

If this option is selected, both 2D curves and 3D geometry is created.

Create only 2D curves

If this option is selected, only 2D curves are created.

Create only 3D geometry

If this option is selected, only 3D geometry is created.

Create geometry in parent layer

If this option is selected all 2D curves and/or 3D geometry is placed on the parent layer of each component they were extracted from.

Create geometry in a new layer

If this option is selected all 2D curves and/or 3D geometry is placed on a new layer with a system generated layer name.

Hide original geometry

Check this box to hide the original component geometry.

Place curves on one plane

Check this box to project all curves onto the XY plane located at the world origin.

Create separate group for each component

Check this box to group each component separately.

Save geometry colors

Check this box to save the original geometry colors for each component.

More Information

The Explode Cabinet Design utility creates curves from 3D geometry to represent features of interest in machining. The following features are detected and curves associated with these features are created with predefined colors:

Feature	RGB Value	Color
Through Holes	RGB (255,0,255)	
Blind Holes	RGB (192,0. 192)	
Through Pockets	RGB (128,0,128)	
Blind Pockets	RGB (255,64,255)	
Dados	RGB (255,128,255)	
Outer Periphery	RGB (64,0,64)	

6.13 Error Messages

The following are some error messages that you might encounter along with some tips when generating toolpaths using VisualCAM.

Inval	id tool	definition.	

When creating/editing tools for all tools types make sure:

- Flute Length value is set smaller than Shoulder Length and Flute Length
- Shoulder Length value is set smaller than Tool Length

For Dove Tail tools check values for Tool Diameter, Flute Length and Taper Angle:

- Make sure these values are geometrically correct. **Hint**: Use the preview window to see if a preview of the Tool for the specified values can be seen.
- See Create/Edit Tools.

Could not find valid data. Internal algorithm failure.

For 2 axis Profiling, if the toolpath you are trying to generate is on the inside of a closed curve/sketch check:

• If Tool Diameter is larger than the width of the selected drive geometry

For 2 Axis Re-machining when the reference Tool Diameter under the cut parameters tab is set to be the same or less than the Tool Diameter of the tool being used for the current operation.

Object(s) used in Machining Operation(s)! Skipping them.

This error can occur when attempting to delete a tool that is currently associated with machining operation:

In the Machining Objects Browser, expand the Tool icon by selecting the + sign (
) to see there are any operations associated with that tool.

Create Nested Sheets

Creating nested sheets of your toolpaths is performed automatically when a toolpath or the Operations to Nest setup are regenerated. Be sure to first define your sheets using the Add Sheets dialog and then define your Nesting Parameters.

7.1 Nesting Parameters

This dialog is used to define the sheets in your nest. It is divided into two parts. The Sheets List at the top and the Sheet Definition at the bottom. Defining a sheet and then selecting the Add Sheet(s) button will create the sheet and add it to the list. Once listed, you can further control parameters for the sheet defined by each column in the list. Refer to each option listed below.

Nesting Parameters Dialog

Nest Params	\times

Neting Parameters

Part Options

This section controls how toolpaths are grouped and oriented.

Orientation Step Angle

This allows rotation of the parts to nest and can be defined by specifying orientation step angle. For example, specifying a Step Angle of 90 would allow rotation of all parts by a step increment of 90, which could be 90, 180 or 270 to fill the sheet optimally.

Orientation Step Angle (True Shape Nesting)

Allow Parts inside other Parts

Check this box to allow parts to be nested inside the cutouts of other parts to maximize sheet utilization.

Use for Engraving & Sign Making

Check this box to use nesting for engraving & sign making. This allows the ability to nest curves inside a hole as shown below. In this example, the outer rectangle would be the part and the exterior & interior of the letters would be treated as holes.

Use for engraving & sign making

Nesting Options

This section controls distances and accuracy of the nested toolpaths.

Distance Part to Part

This parameter defines the minimum distance between each part within a sheet. In the example below, Distance Part to Part is set = 0.25. and Distance Part to Sheet= 0.

Distance Part to Part

Distance Part to Sheet

This parameter defines the minimum distance between parts to the edge of the sheet. In the example below, Distance Part to Part is set = 0.25. and Distance Part to Sheet = 0.50.

Distance Part to Sheet

Overflow Minimum Utilization %

This defines the minimum percent of material utilization that is permitted on any sheet in the nest. If set, then the % of utilization of material for each sheet must exceed this value. If the % of utilization for any sheet is below this value, that sheet will be suppressed from the nest.

This can be used to eliminate remnants on the last sheet used which typically has the lowest % of utilization.

Accuracy

Move this slider to adjust the Simulation Accuracy (Standard, Medium and Fine). This refers to the display accuracy. For example, in Polygonal Mode, more polygons will be added, thus increasing display accuracy.

Auto Tab Options

Use this section to auto tag your nested toolpaths.

Tag Nested Curves Automatically

Tagging allows you to identify nested parts. Check this box to turn Tagging On.

Auto Tag Output

Annotation - The tag number is shown on the screen as graphics display text only. The height of the annotation text is dynamically controlled by the Tag Text Height value.

Annotation Tagging

Geometry - The tag number is created as geometry curves, which are selectable as geometry. Enter the Tag Text Height for tagging.

Geometry Tagging

Tag Text Height

This value is the Text Height for each generated Tag. When Annotation is selected, the Tag is only displayed graphically on the screen using the Text Height value. When Geometry is selected, the Tag geometry will equal the actual Text Height value.

Nested Sheets Layout

Use this section to define the layout of the nested sheets.

Along X

Pick Along X to layout the nested sheets along the X direction (left to right) beginning at the XY origin.

Along Y

Pick Along Y to layout the nested sheets along the Y direction (bottom to top) beginning at the XY origin.

Spacing between Sheets

If either Along X or Along Y is selected, enter a distance value for the Spacing Between Sheets.

Output Sorting

Use this section to determine how the machining operations (Mops) are listed in the Machining Job tree. The sorting is performed within each nested sheet folder in your Machining Job.

Sort Mops by

Select a sorting method:

Default

Mops are sorted in the order they appear in your Operations to Nest setup.

Tool Size ASC

Mops are sorted by ascending tool size (smaller tool diameters first).

Tool Size

Mops are sorted by descending tool size (larger tool diameters first).

Estimate # of Sheets

Select this button and the system will estimate how many sheets are needed and allow you the opportunity to update your sheet count.

E	stim	ated # of Sheets	×
	#	Nested Sheet	Estimated # of Sheets
	1	Sheet 1	3
		U	odate Sheet Count OK
		Esti	mate # of Sheets

Execute Nest

Pick Execute Nest to calculate the final Nest based on all parameters and selections you have made. You are then moved to the Preview Nest tab automatically.

7.2 Add Sheets to Nest

This dialog is used to define the sheets in your nest. It is divided into two parts. The Sheets List at the top and the Sheet Definition at the bottom. Defining a sheet and then selecting the Add Sheet(s) button will create the sheet and add it to the list. Once listed, you can further control parameters for the sheet defined by each column in the list. Refer to each option listed below.

Add Sheet to Nest

Deets List

Description

#

Sheets are automatically numbered at the time of creation.

Name

This is the name of the sheet provided when it was created.

Count

This is the total quantity for this sheet.

Thickness

This is the designated thickness for the sheet.

Starting Corner

This is the starting corner for the toolpath operations nested on this sheet.

Nesting Direction

This is the direction that toolpath operations will be nested on this sheet. For example, beginning at the Lower Left, operations would nested from left to right (Along X).

Grain Direction

This is the grain direction for the sheet. It can be used to control how toolpath operations are oriented on the sheet. For example, if you select Along X here and then select Along Y for Grain Direction on the Nest Parameters tab of the toolpath operation dialog, then that toolpath would be rotated 90 degrees on this sheet.

Select Curve(s)

Pick this button to select geometry to be used as Sheets. You may window-select all closed curves and press <Enter> or <Right-Click> to add them to the selection list. Selecting open profiles is not supported. Sheets are Only periphery shapes and cannot contain holes or cutouts. test

Remove All

Pick this button to remove ALL items from the list.

Remove Active

Select the Remove Active button to remove the currently selected item from the list.

Use these controls to define the parameters for a new sheet. Once the fields are defined, pick the Add Sheet(s) button to add the sheet to the list above.

Name

This will be the Name of the defined sheet.

Length

This will be the Length of the defined sheet measured in the default drawing units.

Height

This will be the Height of the defined sheet measured in the default drawing units.

Thickness

This will be the Thickness of the defined sheet measured in the default drawing units.

Count

This will be the Count total for the defined sheet.

Add Sheet(s)

After entering the sheet dimensions and attributes, select this button to add the sheet to the sheets list.

7.3 Nesting Report

This dialog display a report of the current nested sheets. First regenerate your Operations to Nest setup. This will update your nested sheets. Then display this report to get information on the Nested Sheets results.

Nesting Report Dialog

Nes	ting Report			×
#	Nested Sheet	% Utilization	2 1/2 Axis Profiling (Part 1)	2 1/2 Axis Profiling (Part 2)
1	Sheet 1-1	64.63	15	1

				Print OK

Nesting Report

2 Axis Profiling

2 Axis Profiling is a toolpath method that employs regions and can be used either as a pre-finishing operation or as a finishing operation. These regions are treated as the tops of vertical walls spanning from the Z

values of the regions down to your specified cut depth.

This system does not consider any part surface geometry during computation. The tool types commonly used in this method are Flat End Mills. The operation cuts in parallel XY planes until the desired depth is reached.

As the cutter follows these horizontal planes, it can maintain a climb, conventional o mixed cut direction.

2 Axis Profiling Example

Profiling, 2½ Axis

2½ Axis Profiling

2 Axis Profiling Menu Item

The Profiling toolpath method is invoked by selecting the Program tab and clicking on the 2½ Axis Profiling operation menu selection.

2½ Axis Profiling Menu Item

2 Axis Profiling Dialog

Here is a typical 2 Axis Profiling operation dialog with the Cut Parameters tab selected.

Cut Parameters Tab, 2 Axis Profiling

8.1 Control Geometry

153

Control Geometry refers to the part geometry that controls the current operation. 2 Axis operations can use 2D and even 3D curves and surface edges as Control Geometry. For 2 Axis operations, Control Geometry is divided into two possible categories: Part Regions and Avoid Regions. The Control Geometry tab has sub-tabs for selecting each of these categories of geometry from your part.

Regions must be selected before they can be used in an operation. It should be noted that regions can be created and be present in a part file but if they are not selected in a machining operation then they will be ignored during toolpath computation. So creating a region does not make it active; you must use one of the select button from the Control Geometry tab of the Profile operation before you select Generate.

Region Types by Configuration

			Configura	tion	
Region Type	Xpress (XPR)	Standard (STD)	Expert (EXP)	Professional (PRO)	Premium (PRE)
Curve	1	1	1	1	1
Surface Edge	1	1	1	1	1
Flat Area	1	1	1	1	1
Avoid Regions		1	1	1	1

Note: Some region types are not supported by all operation types.

Control Geometry tab, Profiling, 2 Axis

Part Regions tab

The Part Regions tab displays in all 2½ Axis and some 3 Axis operations. It is used to drive the tool during the operation. Use one of the Select... buttons in this dialog to add Part Regions to the Selected Machining Region(s) list.

See Select Part/Containment Regions for more information.

Avoid Regions tab

The Avoid Regions tab lists the geometry (i.e., Regions) to be avoided by the cutter during the current Mill operation. The outer diameter of the tool will not enter this region.

Note: This feature is not available in Xpress configuration.

See Avoid Regions for more information. This tab is available on the following operation dialogs: Facing, 2½ Axis, Pocketing, 2½ Axis, Profiling, 2½ Axis

Move Up

This button moves the selected item up (i.e., higher) in the list. Items are machined in the order listed.

Move Down

This button moves the selected item down (i.e., lower) in the list. Items are machined in the order listed.

Remove All

If your controller does not support spiral g-code motions, check this box to output spiral motions as linear segments.

Remove Active

Pick this button to Remove the selected Active region from the list. You can select multiple Regions from the list using the Ctrl key and then pick this button to remove them all. The geometry itself is not deleted from the part model.

Select Curve/Edge Regions

Pick this button and the dialog will minimize, prompting you to make a selection from your part. You can select curves or face edges. After completing the selection, the dialog will re-appear with your Region selections listed.

Select Surface Boundary

Pick this button and the dialog will minimize, prompting you *Select surface for boundary*. You can select one or more part surfaces. After completing the selection, the dialog will re-appear with each surface edge boundary listed in the Selected Machining Region(s) list.

Select Flat Area Regions

Pick this button and you are prompted to make a selection from your part. You can select flat planar face geometry. After completing the selection, the dialog will re-appear with your region selections listed.

8.2 Cut Parameters

This Cut Parameters tab is similar for the Mill operations listed below. It allows you to define the cut parameters for the current Profiling operation. You can set Global Parameters, Cut Direction and the Stepover Distance via this tab of the operation dialog. The Global Parameters section allows you to set the tolerance value to be used in machining. A uniform thickness or stock that needs to be left around the part can also be specified here. Refer to each option below.

Dialog Box: Cut Parameters tab, Profiling Operations

Entry/Exit	Advanced I	Cut Parameters	Cornering Pa	rameters	Sorting	Nest	Parameters
Control Geo	ometry Tool	Feeds & Spee			Cut Param	eters	Cut Levels
Comp Cut D ○ Ci ○ Ci ○ Ci ○ Ci ○ Ci ○ Ci ○ Ci U ○ Ci U U · · · · · · · · · · · · · · · · ·	Stock: 0 pensation: A tirection imb (Down C onventional (I ixed tart Point for se Mid-Point se Mid-Point g Side pecify 0 [Right of Curv	.001	Curves	Regio	×	erance	ipath e
	Alternate usi	ng Nesting		-			
	tal Cut Width Step/Cut		4 7 4	Cu		Step	
🗌 Per	form Corner (Cleanup					
		Generate	Cano		Save		Help

Global Parameters

The Global Parameters section allows you to set the tolerance value to be used in machining. A uniform thickness or stock that needs to be left around the part can be specified here.

Tolerance

This is the allowable deviation from the actual part geometry plus the Stock allowance (if any). In 2 Axis methods, this Tolerance is applied to XY motions only.

How to Increase Tool Path Accuracy

Tolerances play a vital role in both design engineering and digital manufacturing. In design, the goal is to allow the broadest tolerance range possible while meeting your design specifications. This is because, generally speaking, there is a direct correlation between tighter tolerances and higher manufacturing costs.

Read the full article...

Stock

This is the thickness of the layer that will remain on top of the part after the toolpath is complete. Roughing operations generally leave a thin layer of stock. For finishing operations this value is zero.

Compensation

This enables cutter compensation. The compensation direction, left or right, is determined by the Cut Direction selected (Climb or Conventional).

Cut Direction

Climb (Down Cut)

Select Climb (Down Cut) and the tool will be maintained in a downward motion into the stock.

Conventional (Up Cut)

Select Conventional (Up Cut) and the direction of the tool will be maintained in an upward motion out of the stock.

Mixed

Select Mixed and the direction of cutting is alternated between each parallel plane. This is a mixture of both Climb and Conventional cutting of the stock.

Understanding Climb vs Conventional Milling

One of the basic concepts to understand in any milling operation is Cut Direction. It can be characterized by how the flutes of the cutting tool engage the stock material and form the chip that is removed during cutting. In many of MecSoft CAM's 2½ & 3 Axis toolpath strategies you will see that Cut Direction is defined by selecting one of three options, Climb, Conventional or Mixed. Let's take a look at the characteristics of each option.

Read the full article...

For Z Level Cuts:

When Mixed is selected, zigzag motions are applied between step downs to eliminate tool retracts between z levels. If Climb or Conventional is selected, retract between z levels are applied. Refer to the images below:

Climb or Conventional

Mixed

Cut Start Point for Closed Curves

Check this box to move the cut start point to the mid-point of the longest side of a closed curve.

Cutting Side

Specify

Select this option to activate the Cutting Side parameters in this dialog.

Right of Curve / Left of Curve

Right or Left determines the side of the curve to cut. This can be set for both open and closed curves. Right or Left is determined by the start point and direction.

Use Inside/Outside for Closed Curves

Select this option if you have a closed curve region. Then select Inside or Outside to have the tool cut on that side.

Alternate using Nesting

If your control geometry has nested curves, check this box to alternate the cut side (i.e., Outside/Inside or Inside/Outside).

Stepover Control

This is how wide your cut should be. The Step/Cut determines your stepover. For example if Total Cut Width is set to 1.0 and Step/Cut is set to 0.25, there will be 4 passes created.

This will determine the stepover for each cutting pass beginning at your total cut width and ending at your control geometry.

Corner Cleanup

Check the Corner Cleanup box to automatically detect corners that the tool could not reach between each pass. The system will then add a toolpath based on the uncut area detected.

8.3 **Cut levels**

The following Cut Levels tab allows you to define the location of the Cut Geometry and various Rough and Finish Cut Level parameters. Refer to each of the sections below for more information. MecSoft Tech Blog: <u>Understanding Cut Levels in 2½ Axis Machining</u>.

Dialog Box: Cut Levels tab

ntry/Exit Advanced Cut Parameters Co	ornering Parameters	Sorting	Nest Parameters

Cut Levels Ordering Depth First Level First	<u>1</u> <u>3</u> <u>4</u>	5 6 7	
Generate	Cancel	Save	Help

tab, I

Location of Cut Geometry

The Location of Cut Geometry can be set to At Top (top Z level), At Bottom (bottom Z level) or Pick Top (specifying the Z location) by entering a Z value location or by

selecting the pick 🔊 button and selecting the point on the part.

🔟 At Top

This uses the Z location of the selected Machining Feature/Region as the top of cut. The generated cuts will start at this Z location and cut down in Z to the specified total cut depth. At Top is typically used when you select the top edge as your machining region.

At Bottom

This uses the Z location of the selected Machining Feature/Region as the bottom of cut. The generated cuts will be above the selected machining region and last cut would be at the Z location of the specified region. At Bottom is typically used when you select a pocket bottom at your machining region.

2½ Axis Facing Operation Examples:

Pick Top

This allows you to specify the Top of Cut for the selected Machining Feature/Region and is typically used when the selected region is not at top or bottom. The generated cuts will start at this specified Z location and cut down in Z to the specified total cut depth. This would be useful when the selected machining region is at the bottom edge of a fillet or chamfer. When two or more curves are selected as Machining Features/ Regions, and using Pick Top for Location of Cut Geometry, sets the Top of cut for all regions at the same Z level.

2¹/₂ Axis Facing Operation Examples:

Cut Depth Control

The Cut Depth Control section provides controls for defining the depth of the cut. First define the Total Cut Depth. Then, enter the Rough Depth and Finish Depth values. You can then define the Depth per Cut for both Rough and Finish passes by entering values.

Total Cut Depth

Enter the Total Cut Depth or select the Pick button and select two points on your part. The depth will be calculated automatically and added to this dialog. Refer to

the illustration below for reference. You can then divide this into a Rough Depth and Finish Depth.

Rough Depth

AFTER the Total Cut Depth is specified, enter your Rough Depth value. For example, if you enter 1.0 for the Total Cut Depth, the Rough Depth and Rough Depth/Cut will automatically default to 1.0. If you then enter 0.75 as the Rough Depth, the Rough Depth/Cut will default to 0.75 also until you adjust it.

Finish Depth

AFTER the Total Cut Depth and the Rough Depth are specified, you can enter a Finish Depth value. This value is optional. You can then proceed to enter a Finish Depth/Cut value.

Rough Depth/Cut

AFTER the Rough Depth is specified, you can use the Rough Depth/Cut field to tell the

system how deep to cut each level until the Rough Depth is achieved.

Select this icon to assign the Cut Depth value that is defined by the tool that is currently active for this operation. **Note**: This icon will ONLY appear in this dialog if the currently active tool has a Cut Depth value assigned to it. Edit the tool definition if desired.

Finish Depth/Cut

AFTER the Finish Depth is specified, you can use the Finish Depth/Cut field to tell the system how deep to cut each level until the Finish Depth is achieved.

Select this icon to assign the Cut Depth value that is defined by the tool that is currently active for this operation. **Note**: This icon will ONLY appear in this dialog if the currently active tool has a Cut Depth value assigned to it. Edit the tool definition if desired.

Clear Island Tops

Check this box to insert an extra cut level at the top of any inner islands or connected step regions.

Use 3D Model to Detect Depth

Check this box ONLY when a 3D model is being used. When checked, the bottom most level of the part is detected (if there are multiple depths) and cut levels will be added to this depth level. Only the Finish Depth (under Cut Depth Control) needs to be specified. The Rough Depth is automatically determined. For multiple pocket selections, the Location of Cut Geometry should all be the same level (i.e., either all At Top, At Bottom or Picked Top).

Cut Level Ordering

Depth First allows you to order the Cut Levels in this operation so that the entire Z depth of each feature is machined before moving on to the next feature.

Level First allows you to order the Cut Levels in this operation so that all regions in a single Z level are machined first before moving on to machine the next cut level.

8.4 Entry/Exit

The following Entry/Exit tab is similar for the Mill operations listed below. Entry and Exit determines the way in which tool enters and leaves the part geometry. MILL Module allows you to specify how the cutter approaches, engages, retracts and departs when starting and stopping a cut.

2 1/2 Axis Profiling	×
2 1/2 Axis Froming	~

Dialog Box: Entry/Exit tab, 2½ Axis Milling operations

Entry Motions

You can set different feeds for plunge, approach, engage, cut, retract and depart moves. The tool moves to the position above the approach point with a plunge

feed, then uses the approach feed rate for the vertical approach motion and engage feed rate for the engage motion.

Lines & Arcs

This is a 2D entry motion consisting of an Approach Motion and an Engage Motion.

For the Approach Motion, enter the approach Length (L). Then, depending on the stock material and cut pattern select the approach angle as either Normal, Tangent or Specify Angle (A) with respect to the stock.

For the Engage Motion select Linear or Radial. In the Linear motion the cutter follows a linear ramp motion, Ramping back and forth from a user specified height to the engage point. The Length (L) of this move, as well as the Angle (A) of this motion can be specified.

Along Path

The Entry path can be defined as a 3D Entry along a specified Path Angle with a Path Height.

None

No entry motion is defined for the current operation.

Exit Motions

The Exit motion consists of a Retract Motion followed by a Departure Motion. The departure motion is a linear motion.

Lines & Arcs

The 2D Exit motion consists of Approach Motion and an Engage Motion. You can set the Retract Motion to Linear and then enter the Length (L) and the Angle (A). Likewise you can select Radial and then simply enter the Radius (R).

For the Departure Motion, enter the departure Length (L). Then, depending on the stock material and cut pattern select the departure angle as either Normal, Tangent or Specify Angle (A) with respect to the stock.

None

No exit motion is defined for the current operation.

None

Apply entry/exit at each cut level

Check this box to apply the Entry/Exit Motions to each cut level.

U Overlap Dist for Closed Profiles

This option allows you to specify an overlap distance for closed profiles to avoid leaving small tool marks at the start point of the part. The toolpath will start as specified, follow the closed profile back to the start point and then continue past for the specified distance. The overlap distance will be restricted so that it cannot exceed the profile length.

8.5 Advanced Cut Parameters

The following Advanced Cut Parameters are similar for the Mill operations where the tab is available. Some parameters listed below may not be supported for every applicable operation. These parameters can be used to control the cuts for high speed machining and are designed to reduce rapid acceleration and deceleration of the machine during the cutting process. They allow smoothing of the toolpaths by introduction of arcs.

 You can use these parameters even if the controller does not support arcs. In this case, make sure that the output is set to Linear output. This can be set in the Set Machining Preferences dialog located on the Machining Browser under CAM Preferences.

Dialog Box: Advanced Cut Parameters tab

Some options shown below are not available for all operations.

Control Geometry	Tool		eeds & Speeds
Clearance Plane	Cut Parameters	Cut Levels	Entry/Exit
Idvanced Lut Parameters	Cornering Parameters	Sorting	Nesting Parameters
Cut Corner Rounding O	ptions	~	K . X
Perform Cut Roundi	ng		
Rounding Radius (r)	0.1		4
Cut Arc Fitting			
Perform Arc Fitting			۲t
Fitting Tolerance (t)	0.01	1	/
- Smooth Cut Transitions		Г	
Use Smooth Cut Co	onnections	-	- 11
		L	
Bridges/Tabs			
○ None ○ Triangul			
Bridge Height (H)	0.1		
Bridge Length (L)	0.2	(
Reduce feed on de	escending motion		
Number of Bridges	2		
O Dist. between Bridg	es 1		

Dialog Box: Advanced Cut Parameters tab, Profile Operation

Cut Corner Rounding Options

Check this box to round sharp corners in the toolpath and specify a Rounding Radius (r). Fillets of the specified radius will be introduced in sharp corners if possible. These fillets will only be introduced on planes parallel to the XY plane.

Cut Arc Fitting

Check this box to Perform Arc Fitting. The system will attempt to fit arcs along the computer toolpath if they lie within the three principal planes (XY Plane, XZ Plane or YZ Plane).

Smooth Cut Transitions

Check this box to add "S" or "C" shaped cut transitions between two successive offset cuts that lie parallel to the XY plane. These Smooth Cut Connections reduce rapid acceleration and deceleration on the machine and extend tool life.

Bridges/Tabs

For the 2½ Axis Profiling operations, select None, Triangular or Rectangular to create bridges along the part boundary. These bridges can be used to hold the part on the table during the actual machining operation. The following parameters are supported:

- Bridge Height (H): See illustrations below.
- Bridge Length (L): See illustrations below.
- Reduce feed on descending motion:

Check this box to reduce the feed rate for the descending motion after each tab. The reduction is governed by the Plunge between levels percentage value defined by the Feeds & Speeds tab of the operation.

- Number of Bridges: See note 1 below.
- Distance between Bridges: See note 1 below.

Rectangular Tabs

Rectangular Tabs

Bridges-and-Tabs-Explored

You may have heard the term Bridges & Tabs mentioned often enough during our many videos and blog posts. Let's take a moment to explore exactly what they are and how they can be used effectively. Because CNC machining is a subtractive manufacturing process, stock material needs to be removed by the cutter until the resulting part's shape is achieved. During this

process, the remaining part needs to be fixed and stable on the bed of the CNC machine tool so that accuracy is maintained during the entire machining process.

Read the full article...

8.6 Cornering Parameters

The following Cornering Parameters are available for all Profiling operations. You can control both External Corners and Interior Corners. You can also filter which corners these controls are applied to by specifying a corner angle range. Please be sure to read the notes below before using these parameters and perform cut material simulations to fully understand how they affect cutter movement.

Important Note: These Internal and External Corner Types require that the Control Geometry selected for the Profiling operation be closed regions or open poly-lines. If your Control Geometry is a single line or multiple disconnected lines, you must use the Default selections or an error message will be returned. You can use these parameters even if the controller does not support arcs. In this case, make sure that the output is set to Linear output. This can be set in the Set Machining Preferences dialog located on the Machining Browser under CAM Preferences.

Tip: Location of Start Points: If the start point is at a vertex where the corner is being applied, it is automatically moved to the corner.

Dialog Box: Cornering Parameters tab

Control Geometry	Too	ol	F	eeds & Speeds
Clearance Plane	Cut Parameters		Cut Levels	Entry/Exit
Advanced Cut Parameters	Cornering Parar	neters	Sorting	Nesting Parameter
External Corner Type				
O Round (Default)

O Loop				
0		L		
External Corner Filters				
Minimum Angle: 1	80	Maxim	ium Angle:	270
- Internal Corner Type		Г		
Sharp (Default)				
C on alp (b or dails)				
🔿 Dog Bone				
O T Bone				
Internal Corner Filters				
Minimum Angle: D	 ▲ ▼ 	Maxim	um Angle: [135
		Maxim	um Angle: [

Dialog Box: Cornering Parameters tab, Profiling, 2 Axis

External Corner Type

The External Corner Type selected will be applied to all corners measured between the Minimum Angle and Maximum Angle values provided.

Round (Default)

This the default External Corner Type. The tool rolls around the sharp corner.

Depending on the toolpath Tolerance, this method can cause rounding of the sharp corner. NOTE: This option must be used if your Control Geometry is not closed or is not a ploy-line!

Round

Sharp

This External Corner Type will force the tool to proceed past the corner vertex. When the tool diameter becomes tangent with the projected edge direction, it proceeds along the secondary edge.

Sharp

Sharp Limited

This External Corner Type will force the tool to proceed past the corner vertex by a specified Overshoot Length. If the Overshoot Length is specified as a distance less than the tool radius, a round is added at the corner. The radius of the round is equal to the tool radius minus the Overshoot Length. If the Overshoot Length is equal to or greater than the tool radius the Sharp Corner Type is used.

Sharp Limited

Loop

This External Corner Type will force the tool to proceed past the corner vertex by a specified Loop Radius before it proceeds tangent to the secondary edge. The radius is measured tangent to the secondary edge.

L External Corner Filters

Minimum Angle

This is the Minimum Angle for corners to be considered for an External Corner Type. Corner angles below this value will use the default round method for external corners.

Maximum Angle

This is the Maximum Angle for corners to be considered for an External Corner Type. Corner angles above this value will use the default round method for external corners.

Internal Corner Type

The Internal Corner Type selected will be applied to all internal corners measured between the Minimum Angle and Maximum Angle values provided.

Sharp (Default)

This is the default Internal Corner Type. The tool will change directions when it meets the approaching edge. NOTE: This option must be used if your Control Geometry is not closed or is not a ploy-line!

Sharp

Dog Bone

In this Internal Corner Type, the tool will stop when it meets the approaching edge and then proceed directly to the corner vertex point. The tool will then reverse direction back to the previous point and proceed tangent with the approaching edge.

Dog Bone

T-Bone

In this Internal Corner Type, the tool will stop when its diameter meets the approaching edge and then continue tangent until it reaches the corner vertex. The tool will then reverse direction back to the previous point and proceed tangent with the approaching edge.

		_	П
_		 _	

Internal Corner Filters

Minimum Angle

This is the Minimum Angle for corners to be considered for an Internal Corner Type. Corner angles below this value will use the default sharp method for internal corners.

Maximum Angle

This is the Maximum Angle for corners to be considered for an Internal Corner Type. Corner angles above this value will use the default sharp method for internal corners.

8.7 Sorting

The following tab allows you to define Sorting parameters for the current Profiling operation. If No Sort is selected, operations will be performed in the order in which the regions were created or selected. The Minimum Distance Sort and Directional Sort options are described below.

Dialog Box: Sorting tab

Control Geometry	Tool		Feeds & Speeds			
Clearance Plane	Cut Parameters		Cut Levels	Entry	/Exit	
Advanced Cut Parameters	Cornering Parameters		Sorting	Nesting Par-	Nesting Parameters	
O No Sort	Minimum Distar	nce Sort	◯ Direct	ional Sort		
Minimum Distance Sort						
Start Point	Inner Bight					
Lower Left OL						
			1	î		
 Directional Sort Primary Sort Direction 	(P)					
Start Angle (A)	(r) •		۵ <u> </u>			
Secondary Sort Direc	tion (S)					
Low to High C) High to Low	-	tart oint	End Point		
Traversal Pattern						
🔾 Zig 🖉) ZigZag					
Cut Order						
Inside/Out	Outside/In					

Dialog Box: Sorting tab, similar for 2½ Axis Hole Making, Pocketing & Profiling Operations

🛄 No Sort

If No Sort is selected, operations will be performed in the order in which the regions were created or selected.

Minimum Distance Sort

This option sorts based on the shortest distance between regions based on the start point of the regions. This option allows you to set the sort based on the Start point. This start point can be one of the following:

Directional Sort

The directional sorting is performed according to the Primary and Secondary sort directions. The Primary Sort Direction (P) is defined by Start Angle (A).

The Secondary Sort Direction (S) is always perpendicular to primary direction and can be defined to go from Low to High value or from High to Low value. In addition to this the traversal of the cutter can also be defined as either Zig (one way) or ZigZag (two ways). Refer to the dialog box images below:

Perform Clustering (not available for all operation types)

These parameters allow you to sort machining regions by clusters. A cluster is when one region is completely enclosed within the boundary of another region. This relationship defines one cluster. There can be multiple clusters selected for an operation and these options will sort them for machining.

Perform Clustering

Check this box to enable clustering and then select which method to use. A cluster is when multiple regions are completely enclosed within the boundary of another region.

Inside/Out

Select this option to machine one complete cluster at a time starting with all of its inner regions first before machining its outer region.

Outside/In

Select this option to machine one complete cluster at a time starting with its outer region before machining all of its inner regions.

8.8 Tool Tab

The following dialog allows you to select the appropriate tool for the current operation. The Tools in Session are listed on the left. Expanding the Tool tree will list the current operations assigned to that tool. See <u>Create Edit Tools</u> for more information.

/2 Axis Profiling				
Advanced Cut Parameters	Cornering Param	eters	Sorting	Nesting Parameters

Dialog Box: Tool tab, similar for all Milling Operations

Edit/Create/Select Tool ...

If there are no Tools listed, select this button to Create a new tool. If a tool is listed and selected by default, select this button to Edit the parameters for that tool or to Select a different tool for the current operation.

Preview Tool

Select this button to display a graphical representation of the currently selected tool. This is the same Preview of the tool that you see displayed in the Edit/Create/Select Tool dialog.

8.9 Feeds & Speeds

The following Feeds & Speeds tab is displayed for all Mill operations. It allows you to select the appropriate Feeds & Speeds for the current Mill operation. In this tab, Spindle Parameters and Feed Rates can be specified. Speeds & Feeds can also be loaded from a File or from the Tool.

Feed Rates Explained

Feed Rate is one of the most important factors to consider when implementing any CNC strategy. Simply put, feed rate is the speed at which the cutter engages the part and is typically measured in units/minute. Suggested cut feed rates will vary depending on the

type of material you are cutting (i.e., aluminum, steel, wood, acrylic, etc.), the material of the cutter (carbide, high speed steel, ceramic, etc.) and many other cutting factors including desired surface and the characteristics of the CNC machine itself.

Dialog Box: Feeds & Speeds tab,2 Axis Profiling

Spindle Parameters

These parameters refer to the spindle on your machine.

Spindle Speed

This is the rotational Speed (S) of the milling spindle expressed in RPM.

Spindle Direction (CW)

This sets the spindle rotation to be Clockwise (CW).

Spindle Direction (CCW)

This sets the spindle rotation Direction to be Counter Clockwise (CCW).

Feed Rates

These are the feedrates (in Units/Min) that will be applied to the current toolpath operation. If the values are currently populated from your Tool definition (Load from Tool), Feeds & Speeds table (Load from File) or from your Knowledge Base, you can override them for this operation.

Plunge (Pf)

This is the rate is the feed before the tool starts to engage in material. This is always vertical.

Approach (Af)

This is the Approach (Af) feedrate (in Units/Min) used to prepare the cutter just before it starts to Engage into material for cutting. Approach motions are dependent on the method of machining.

Engage (Ef)

This is the Engage (Ef) feedrate (in Units/Min) used when the tool is Engaging the material just prior to cutting.

Cut (Cf)

This is the Cut (Cf) feedrate (in Units/Min) used when the tool is Cutting material.

Retract (Rf)

This is the Retract (Rf) feedrate (in Units/Min), when the tool is performing a Retract move away from material.

Departure (Df)

The is the feedrate (in Units/Min), when the tool Departs from the material.

Transfer (Tf) Use Rapid

This is the Transfer (Tf) feedrate (in Units/Min) used for Transfer motions. If you select Use Rapid the posted G-Code will output a rapid motion (G0) with no feed rate. Note: For more accurate machining time estimates, use the Set option and enter the feed rate to use.

Transfer (Tf) Set

This is the Transfer (Tf) feedrate (in Units/Min) used for Transfer motions. Select Set to enter an actual feedrate value for rapid motions (G0). This is only used for calculating the estimated machining time.

Feed Rates Reduction Factors (Hole Operations Only)

This section of the dialog allows you to specify Feed Rate Reduction Factors for specific tool motions.

Plunge between levels

This is a percentage of the Cut (Cf) feedrate to use when the tool is plunging between Z levels.

First XY Pass

This is a percentage of the Cut (Cf) feedrate to use on the first XY cut motion when the toolpath uses the full width of the cutter.

Coolant

Here you can override the Coolant that is specified by the Tool. Coolant can be set to Flood, Mist or Through. Coolant codes are defined in the post processor generator under Misc tab.

Load from Tool

Load the Feed & Speeds values that are saved with the currently selected Tool.

See: Create/Edit Tools

Load from File

This loads the Feeds & Speeds values from the Feeds & Speeds Table file. This will display the Load Feeds from Table dialog box to make your selections.

Dialog Box: Load Feeds from Table

Selecting OK from this dialog transfers the spindle speed and cut feedrate to the Feeds & Speeds tab. The plunge, approach, engage, retract and departure feeds are determined using a percent of the cut feed. The percent to use for transferring the computed cut feed can be set under Feeds & Speeds Preferences.

Dialog Box: Load Feeds from Table

Data from Table

These selections and calculations are defined in a feeds and speeds data file which can be edited to add newer materials. See our blog post <u>How to</u> <u>Customize Materials Data for Feeds & Speeds Computation</u> for more details.

Stock Material

Select the desired Stock Material from this list to use in Feeds/Speeds calculations.

Tool Material

Select the desired Tool Material from this list. CARBIDE, HSS CERAMIC are supported. The material is used in the tool's Feeds/Speeds calculations.

Surface Speed

Selecting a Stock Material and Tool Material displays the Surface Speed and

Feed/Tooth. This information is contained in a feeds and speeds data file which can be edited to add newer materials.

Feed/Tooth

Selecting a Stock Material and Tool Material displays the Surface Speed and Feed/Tooth. This information is contained in a feeds and speeds data file which can be edited to add newer materials.

Input Variables

The input variables Tool Diameter and Number of Flutes are automatically loaded based on the tool selected for the operation. Based on these parameters, the program computes Spindle Speed and Cut Feedrate. Changing the Spindle Speed modifies the Cut Feedrate.

Maximum Limits for Computation

Here you can set the Max Spindle Speed and Max Cut Feed (Cf) values. Once these two values are set, the Spindle Speed and Cut Feed calculated by this dialog will not exceed these values even if you attempt to enter higher values into the Computed Variables fields. To exceed these values, change them here or you must edit the operation or tool parameters manually. This value <u>WILL NOT</u> exceed the High Value set in your current post-processor selection. To do so you must edit the post using the Post-Processor Generator (Program tab > Post > Current Post Processor > Edit > Feedrate > High Value).

Computed Variables

The variables for Spindle Speed and Cut Feed (Cf) are computed for you based on the selections made in this dialog but will not exceed the values set in the Maximum Limits for Computation section of the dialog. These values are then assigned to the active toolpath operation or tool. You can override either of these variables and the other will update automatically. Since this dialog is a Feeds & Speeds Calculator, you cannot override both values. To do so, you must edit the operation or tool parameters manually.

The Milling Feeds & Speeds Calculator

Did you know that MecSoft's MILL Module plug-ins have a built-in Feeds & Speeds Calculator? That's right, you can ask the program to suggest feeds & speeds values based on your current stock material and active tool parameters! Once a Cut Feed is calculated, you can then choose to automatically assign feed rate values for the various toolpath motions in your operation including Plunge, Approach, Engage, Retract and Departure! The percentages of the Cut Feed to assign are all controlled from the CAM Preferences dialog. The Milling Feeds & Speeds Calculator...

Read the full article...

Customizing Feeds & Speeds

MILL module allows you to customize the feeds and speeds based on the stock material being machined, the material of the cutter employed and also the operation type. This is done by archiving your desired feeds and speeds settings in an external data file.

A default implementation of this table has been included with the VisualCAM product and can be found in a folder called "Materials" under the product installation directory.

This xml contains the list of materials, texture, feeds and speeds. The file is located under Materials folder in the VisualCAM install directory. (C:\ProgramData\MecSoft Corporation\VisualCAM 2020\Materials).

Materials folder contains the following files

- FeedsSpeedsDataINCH.xml
- FeedsSpeedsDataMM.xml

The Feeds and speeds file is an .xml file format, which can be edited using any text editor to add newer materials. These values can then be recalled at any time to compute the feeds/speeds to be used in the current program.

The format for this file is shown below.

<units>Imperial</units>
<feedsspeeds></feedsspeeds>
<material></material>
<name>Stock Material</name>
<texturefile>Texture Bitmap</texturefile>
<feedsspeedsrecord>Operation type, Tool Material,</feedsspeedsrecord>
Surface Speed, Feed per Tooth

An example entry is shown below.

<Material>

<Name>ALUMINUM - 2024</Name> <TextureFile>ALUMINUM.bmp</TextureFile> <FeedsSpeedsRecord>MILLING, CARBIDE, 1600.00, 0.0040</FeedsSpeedsRecord> <FeedsSpeedsRecord>MILLING, HSS, 400.00, 0.0040</FeedsSpeedsRecord> <FeedsSpeedsRecord>MILLING, CERAMIC, 400.00, 0.0040</FeedsSpeedsRecord> <FeedsSpeedsRecord>DRILLING, CARBIDE, 960.00, 0.0048</FeedsSpeedsRecord> <FeedsSpeedsRecord>DRILLING, HSS, 240.00, 0.0048</FeedsSpeedsRecord> <FeedsSpeedsRecord>DRILLING, CERAMIC, 240.00, 0.0048</FeedsSpeedsRecord> <FeedsSpeedsRecord>DRILLING, CERAMIC, 240.00, 0.0048</FeedsSpeedsRecord> <FeedsSpeedsRecord>TURNING, CARBIDE, 1800.00, 0.0200</FeedsSpeedsRecord> <FeedsSpeedsRecord>TURNING, CERAMIC, 1800.00, 0.0200</FeedsSpeedsRecord> <FeedsSpeedsRecord>TURNING, CERMET, 1800.00, 0.0200</FeedsSpeedsRecord> </Material>

> If part unit is set to Inches, MILL module automatically loads FeedsSpeedsDataINCH.xml and when part unit is set to MM, FeedsSpeedsDataMM.xml is loaded.

More on Customizing Materials Data

Note: This blog post is intended for advanced users who are familiar with XML text editing and have administrative access to their Windows Operating System. MecSoft's CAM plug-ins have a built-in Feeds & Speeds Calculator that can suggest Spindle Speeds and Cut Feed Rates based on your stock material and active tool parameters! However, what if you are cutting stock material that is currently not in our Materials Library? Or what if you don't like what is currently assigned for the material of your choice in the

Materials Library? This post will show you how to customize MecSoft CAM to add and manage multiple material files as well to add your own stock materials. If you are new to MecSoft's CAM plug-ins, you can review my earlier post on the Feeds & Speeds Calculator and how it works.

Read the full article...

8.10 Clearance Plane

The clearance plane is an XY plane wherein all transfer motions between a retract and engage motion takes place. In the case of 4 axis operations, the clearance plane is a cylinder and defined along the axis of rotation. Typically you would define this plane at a certain safety distance above the part geometry. This is done to prevent the tool from touching the part being machined during transfer motions since these motions usually use a very fast or rapid feed rate.

Dialog Box: Clearance Plane tab

Advanced Cut Parameters	Cornering Parame	eters Sortin	ng 👘 Nesting F	arameters
Control Geometry	Tool		Feeds & Speeds	
Clearance Plane	Cut Parameters	Cut Lev	vels Er	try/Exit
Clearance Plane Definition Automatic			€ Stock M	lax Z
O Part Max Z + Dist	0.25 🌲			
◯ Stock Max Z + Dist	0.25			Part Max Z
○ Absolute Z Value	0.25			
Ignore Wireframe Ger Cut Transfer Method	Sinetry in Dounds Col	npotation		
 Skim Skim Clearance (C) Clearance Plane 	0 🔺	Clearar	nce Plane	
			Part ax Z	

Clearance Plane Definition

This selection defines the Clearance Plane for the current toolpath operation.

Automatic

Allow the system to calculate a the clearance plane height automatically based on the part and stock geometry.

Part Max Z + Dist

Set the Clearance Plane height to the maximum Z height of the Part plus this added distance.

Part Max + Dist

Stock Max Z + Dist

Select this option to use the Stock's Maximum Z height and then enter a Distance value to add to this for the total Z height for the Clearance Plane.

SLOCK IVIAX +

Absolute Z Value

Select this to specify the absolute Z clearance height to use and then enter Z height value. Be sure that the value you specify clears your part geometry.

Absolute Z Clearance

Ignore Wireframe Geometry in Bounds Computation

Check this box to ignore all wireframe geometry when calculating the Clearance Plane definition. When checked, the Automatic and Part Max options for defining the Clearance will be calculated from actual surface geometry.

Ignore Wireframe Geometry in Bounds Computation

Cut Transfer Method

This section allows you to control the tool's motions when it needs transfer to another region to begin cutting.

Clearance Plane

Select this option to move the tool to the Clearance Plane and then perform the Transfer motion to the next cut location.

Transfer at Clearance Plane

Skim

Select this option to perform transfer motions at a Skim plane. The system automatically determines a safe height and then adds this Skim Clearance (C) to the computed Z value to perform the Transfer Motions.

Display of Clearance Plane for Milling operations

When the clearance plane dialog is active, specifying a clearance plane definition, displays the clearance plane on the part in the view port.

Display of Clearance Plane for Milling operations

Edit Operations

193

Once a Profile operation is created it is listed under the Machining Browser. By default all the operations are created under the setup named Operations to Nest. The setup can hold several Profile operations and each operation can be associatively edited and regenerated.

📙 The Program Tab of the Machining Browser

Changes can be made to any of the objects that make up the operation such as the Control Geometry, Tool, Feeds/Speeds, Clearance Plane and Machining Parameters. Any edits made to an operation are saved with the operation and upon regeneration the changes will take affect.

Machining Browser

9.1 Edit Associatively

Profile operations can be edited by using the Machining Browser. Each operation is represented as a folder in the browser. In the expanded state of a Profile operation folder, seven icons representing different objects that make up the operation are displayed. The first five can be associatively edited.

The Machining Operation Tree Icons

The following icons are displayed under a machining operation's folder and represent the different objects that make up the operation. The first five (Machining Features, Tool, Feeds/Speeds, Clearance Geometry and Parameters) can be associatively edited.

Double Click to Open an Operation Dialog for Editing

Double clicking on the operation folder (or name) will open the operation's properties dialog with all tabs displayed for editing.

Right or Double Click one of an Operation's Icons to Edit its Properties

Right mouse click or double clicking a specific icon, for example the Tool icon would bring up the Tool Creation dialog, upon which you can substitute the current tool with another or edit the parameters of the current tool.

Click on this Icon	Displays the Operation's	
ල්	Control Geometry tab	
A	Tool tab	
3	Feeds/Speeds tab	
4	Clearance tab	
	Cut Parameters tab	
Ŵ	Toolpath in the Toolpath Viewer	

Right or Double Click one of an Operation's Icons to Edit its Properties

Drag & Drop a Tool from the Object Browser to an Operation

The tool can also be edited by dragging and dropping a tool from Tools tab to the Machining Browser.

Display of Operations that need Regenerating after Editing

If any of the objects that make up the operation were to be edited after the toolpath was initially generated, the operation will be flagged dirty (i.e., needing regeneration). This condition is indicated by adding a red marker $\stackrel{P}{\longrightarrow}$ to the operation folder. Also, the object that necessitated this condition $\stackrel{P}{\longrightarrow}$ is also displayed with a red marker.

An example of this is shown below. In this case the tool used in the operation was edited after the machining operation was created and so is shown differently, as is the operation.

Display of Operations that need Regenerating after Editing

Profile operations will be flagged if any associated parameters outside of the operation are edited. For example, if the geometry is modified, all Profile operations dependent on that geometry will be flagged for regeneration. In the example below you see that the Profile folder, Control Geometry and the In-process Stock are flagged, letting you know that the operation needs to be regenerated and simulated.

Regenerating "Flagged" Machining Operations

In order to regenerate the operation that is flagged with a red marker, you would have to select the operation, right click and select Regenerate.

The toolpath is now generated with the modified settings. Notice that the In-process Stock is still flagged. This alerts you that it has not been simulated yet.

9.2 Copy/Paste

You can Copy and Paste machining operations in Machining Browser. To Copy an operation, select the operation under the Machining Browser, right-click and select Copy.

Machining Browser: Paste an Operation

Edit or Regenerate the Operation

This creates a copy of the operation located under the currently selected operation. If you picked Yes to the Execute Nest message dialog, additional sheets are added to the Nested Sheets list to accommodate the additional operation.

You can then edit the operation and regenerate toolpath.

9.3 Delete

To Delete a machining operation, select it from the Machining Browser, right click and select Cut from the context menu.

⊡~ 🏀 Machining Job

Delete from Right-Click Menu

Alternate Methods to Delete an Operation

Alternatively you can delete a machining operation by:

- Selecting the operation and pressing the Delete key on your keyboard.
- Selecting the operation and dragging the operation out of the mops browser to the viewport area.

9.4 Rename

You can Rename a machining operation or the Setup in the Machining Browser by selecting it, right click and select Rename from the context menu.

Select Rename from the Right-click Menu

Selecting Rename allows you to edit the operation name.

Conventions for Renaming Operations

Do not use any of these common illegal characters/symbols in your Mop Names:

DO NOT USE these Characters when renaming Mops					
#	pound	?	question mark		
%	percent	/	forward slash		
&	ampersand	\$	dollar sign		
{	left bracket	!	exclamation point		
}	right bracket	I	single quotes		
١	back slash	"	double quotes		
<	left angle bracket	:	colon		
>	right angle bracket	@	at sign		
*	asterisk				

Also, keep these rules in mind:

- Do not start or end your Mop Names with a space or period
- Keep your file names to a reasonable length and be sure they are under 31 characters.

9.5 Suppress

You can Suppress a machining operation in the Machining Browser by selecting it, right click and select Suppress from the context menu. Suppressed operations will not be displayed, posted or simulated. You can also right-click and Unsuppress an operation.

The Suppressed Operation Icon

A Suppress operation will display in the Machining Job with the following icon:

🖃 🎼 Machining Job

Dialog Box: Machining Operation Properties

Name

Change the Name of the Machining Operation.

Program

Specify Program # for the operation. This program number will be output during post processing of the operation.

Simulation Color

This allows you to specify a unique color for this operation during Simulation display. Refer to the Simulate tab Status Bar for setting the simulation to display by Mop (i.e., machining operation type).

Comments to Output

You can also include commands that will be saved with the operation. These comments will also be output during post-processing of the operation. This might be a good place to put in comments or instructions for the machine tool operator.

This can be used to put in add comments or instructions for the machine tool operator!

Previously Output To File

This refers to the name of the external post-processed file that this particular operation was output to.

Previously Output On

This refers to the last time the operation was post-processed and the time the post-processing was performed.

Simulate

MILL module offers very powerful cut material simulation functionality to allow you to simulate actual machining of the generated toolpaths. The output of this simulation is a true 3D cut model. This 3D model can be rotated, zoomed and manipulated.

This cut model can be visually compared with the part model to show areas of uncut material and/or areas of over-cut material using this component. The simulation features allow the early detection and correction of programming errors.

3 Types of Simulation Available

There are three kinds of toolpath simulation available in MILL module. These are

- 1. Tool Animation
- 2. Cut Material Simulation
- 3. Machine Tool Simulation

The simulation can be performed either on the currently active machining operation or on multiple operations.

Simulate the Active Operation

The active operation is the one that is selected and shown highlighted in the Machining Browser. Typically, this would be the last toolpath that was generated. To simulate any operation, select the operation in the browser and click Simulate from simulate tab of the browser or by using right click and Simulate.

Simulate the Active Operation

Simulate Multiple Operations

To perform simulation on multiple operations select the last operation, right click and choose Simulate Until. You can also select multiple operations by holding down the Ctrl key.

Simulate Until the Active Operation							

Simulate all Operations within the Operations to Nest (Setup)

Alternatively you can select a Setup and select Simulate to simulate all the operations within a Setup.

Simulate one or more Nested Sheet

You can also simulate one or all of your currently nested sheets or one or more nested operations within a nested sheet. You can use the same selection and right-click options on sheets as you can of operations. you can select a Setup and select Simulate to simulate all the operations within a Setup.

Simulate one or more Nested Operations

10.1 Tool Animation

Simple tool animation can be carried out in MILL module by using the controls on the Simulate tab. If there is no stock loaded or if the stock is loaded and the stock visibility is turned off then the tool can be animated to follow the toolpath by setting the step increment to the desired value and clicking on the Simulate button on the Simulate tab of the browser or by selecting an operation and choosing right click to simulate.

Location of the Toggle Stock Visibility Icon

You can also choose to display the toolpath as the tool is being animated. This is a powerful function that allows you to actually watch the toolpath being displayed on the screen incrementally. To do this make sure Toolpath Visibility is turned on before starting the tool animation along the toolpath.

Location of the Toggle Toolpath Visibility Icon

10.2 Cut Material

Available in:	Xpress	Standard	Expert	Professional	Premium
	v	v	v	v	1

As mentioned earlier, the Profile-NEST module offers very powerful cut material simulation functionality to allow you to simulate actual machining of the generated toolpaths. To perform cutting simulation, a Stock model must be defined and displayed and a machining operation must be active.

Selecting Play on the Simulate tab simulates the selected operation.

### An Example of Cut Material Simulation

The output of this simulation is a true 3D cut model. This 3D model can be rotated, zoomed and manipulated. This cut model can be visually compared with the part model to show areas of uncut material and/or areas of over-cut material using this component. An example of cut material simulation is shown below.

An Example of Cut Material Simulation

# An Example of Voxel Simulation Visual Artifacts

When the Simulation Model is set to Voxel, in some cases, especially when simulating cutting of vertical walls (as is typically done in 2 axis machining), the Voxel simulation model leaves visual artifacts at these areas. The reason for this is that the Voxel simulation model display resolution is not very high along the Z-axis. This causes jagged areas to be displayed under these circumstances. It should be emphasized that these are purely visual artifacts and do not represent the true output that would be generated on the machine tool. An example of this visual artifact is shown below. To avoid this, change the Simulation Model to Polygonal under Preferences..

#### 10.2.1 Advanced Engine

There are two material removal simulation modes (or models) available for use. The main advantage of the Voxel method is very rapid processing times. The Polygonal method is more comprehensive and results in better display quality, however at the expense of speed.

To change the simulation module in the Profile-NEST module, select Simulation Preferences located under the Simulate tab or select CAM Preferences > Simulation Settings button under the Machining Browser and select the appropriate model for simulation.

Refer to Simulation Preferences for a detailed description.

#### 10.3 Material Texture

Material texture can be applied to your cut material simulations. This functionality allows you to simulate actual machining of the generated toolpaths with material textures applied.

To Prepare for Cut Material Simulation with Material Texture

- 1. Stock model must be defined and displayed.
- 2. Material must be defined under the Program tab
- 3. Turn on Material Texture Visibility

Ne Sheets	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Location of the Material Texture Visibility Icon

4. A machining operation must be active.

#### To Perform the Simulation

Then using the controls in the Simulate tab of the Machining Browser you can perform the cutting simulation.

See Material for a detailed description.

### Example of Cut Material Simulation with Material Texture

An example of cut material simulation with material texture is shown below. The Material is set to Wood under Choose Stock Material.

Example of Cut Material Simulation with Material Texture

#### **Post-Process**

Once nested sheets are created they can be post processed to a specific machine controller. To post process a nested sheet, select the Sheet in the browser, right click and select Post. The product comes with a set of over 300 post-processors to choose from.

#### Example of Posting a Nested Sheet

#### Post-processing Multiple Machining Operations

You have the ability to select multiple operations within a nested sheet of machining and post process them with a single button click. To do this expand the nested sheet, select the operations and right click and select Post.

You can select multiple operations by holding down the Ctrl key.

Example below shows posting multiple machining operations.

🗊 👘 📁 2 1/2 Axis Profiling (Part 3)

🖶 🎦 2 1/2 Auita				

Selecting multiple operations by holding down the Ctrl key for posting

#### Post from the Program & Simulate tabs

Post-processing can be done from the Program or Simulate tabs under the Machining Browser.

Selecting Post will display the Post and Save As Dialog.

The following are the default settings when the Post and Save As Dialog is displayed.

- Post & Save As Dialog points to the folder location where the part geometry is located.
- Save as type this refers to post file extension. This information is obtained from the Program tab > Set Post Options dialog.
- Current Post this refers to the controller/post processor to post process the toolpath. This information is also obtained from the Program tab > Set Post Options dialog.

You can override the default settings using the Post & Save As Dialog.

Select Post and the posted file will be written to the specified folder.

Dialog Box: Post & Save As

#### Tool Number Validation during Posting

Tool number conflicts are flagged before post-processing multiple operations. If multiple machining operations use different tools but with one or more coincident tool numbers, you are notified of this condition with the following message:

?	Different tools with the same tool number found in the operations selected to be posted! Do you want to continue?	
	Yes No	

#### 11.1 Set Post Options

**Post** You can specify certain post-processor options and rules for post processing. This is done by selecting "Set Post Options" from the Program tab under the Machining

#### Browser.

This will bring up the following dialog.

Dialog Box: Set Post-Processor Options

Set Post-Processor Options	×
Set Post-Processor Options	
Select Post Processor Current Post Processor: Haas Folder where post-processor files are located: ramData\MecSoft Corporation\ Program to send posted file to	
notepad

When posting all in file, use	
Part File Name 🗸 🗸	
Posted File Extension: .nc   Add New	
Show Output Dialog when Post-Processing	
OK Cancel Help	

Dialog Box: Set Post-Processor Options

### Current Post Processor

User can change the default post processor by selecting a post from the list of available post processors under Current Post Processor.

### Folder where post-processor files are located

MILL module uses macro files with a *.spm* extension to handle post-processing to different controllers. These files are typically located in the "Posts" directory under the VisualCAM installation folder(*C:\ProgramData\MecSoft Corporation\VisualCAM 2020\Posts\Mill*).

MILL module by default looks in this directory to build the list of available postprocessors shown under the Current Post. User can change the post processor by selecting a post from the list of available post processors under Current Post.

To change the post processor file location, you can specify the folder to find the Post-Processor macro files by selecting the "Browser for Folder" button in the dialog.

#### Program to send the Posted file to

This feature allows you to specify a program to display the posted file. This could be a NC editor or a text editor like Notepad.

You could also have this point to your control software's executable file and VisualCAM will automatically launch this application when the machining operations are post processed.

#### Posted File Naming Conventions

This allows you to set rules for posted file name when post processing machining operations.

When a machining operation is selected for posting you can set the output file name from one of the following options.

- Part File Name + Machining Operation Name
- Part File Name + Setup Name + Machining Operation Name
- Setup Name + Machining Operation Name
- Machining Operation Name

When a setup is selected for posting you can set the output file name from one of the following options.

- Part File Name + Setup Name
- Setup Name

When Machining Job is selected to Post All, you can set the output file name from one of the following options.

- Part File Name
- Part File Name + First Setup Name
- First Setup Name

#### Posted File extension

You can select a posted file extension from the list or add an extension to the list by selecting Add new button. This displays the Post File Extension dialog shown below where you can specify a new file extension and click OK.

**Dialog Box: Post File Extension** 

The new file extension is now set as your posted file extension automatically.

By default VisualCAM performs interactive post-processing. That is, when you select a toolpath for post-processing, VisualCAM launches the post-processor and waits for it to complete. You can also turn off the display of the output dialog (post and save dialog).

During interactive post-processing, VisualCAM launches the NC editor to view the output file. You can specify a different NC editor to use. See Program to send the Posted file to above for doing this.

#### Archive

Once machining operations are created they can be archived along with the VisualCAD part (.vcp) file. This can be accomplished by simply saving the part file. When the part file is retrieved, all archived operations will be loaded along with the part file.

#### **Find More Resources**

Download this PDF Guide for a list of the available VisualCAM Resources.
